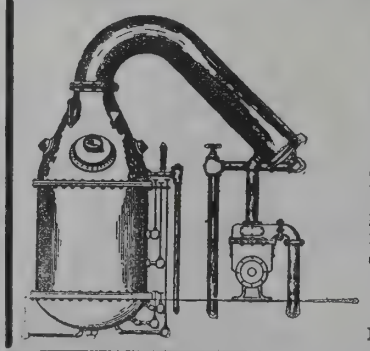
The first thing we note is the natural richness of the soils. Those on which the cattle are bred and used in dairy husbandry generally range from light to exceedingly heavy clays, although some fine herds are found on loam and peat soils. The larger cattle are found on the heavier soils. So important, in the development of cattle, do breeders regard the influence of soils, their herd books require that the kind of soil on which the animal is bred and raised shall be published in its entry. In their view, the value of a pedigree may be determined to some extent by the soils on which the animals included in it were bred. I do not propose to draw any inferences in this paper as to the value ot the various features of the environment that I shall try to describe. I leave this for the discussion that I hope will follow.

The second thing we note is the climate and the provisions made against its extreme severity in winter. It is said that the ice freezes on the Ij, an arm of the Zuyder Zee, at Amsterdam, to the depth of three and a half feet. The region is a stormy one in winter, it lies so exposed to the sleets and blasts of the North Sea. Against these the cattle must be protected. Immense structures–call them houses or barns—are seen in every direction, in which the cattle are kept during this period, in close intimacy with the farmer's whole family. In form they resemble immense tents. A description of one will give the general type. On the ground, 80 ft. wide and 135 ft. long; outside wall of brick, 6½ feet high; an inside structure of large poles similar to our telegraph poles supports a very steep roof, the ridge of which is forty or fifty feet from the floor; in the rear is a modern structure about twenty wide and thirty-five feet long in which are a narrow hall, a family sitting room and parlor. The kitchen is in the main building, a door opens from it into the cow stable, which is about sixteen feet wide, and runs one side of the great structure its full length. It accomodates thirty-six cows in stalls, two in a stall, a window in each stall fronting the cows. Here they are fed and watered during the whole winter without leaving their stalls. They have no exercise save what they get in the stalls.

This stable seems to be comfortably warmed by the heat that emanates from the cows, but do they have sufficient change of air? About eight feet above the stable is a loose covering of boards on which there is a layer of loose straw. Evidently to a certain extent the heated air from the bodies of the cows passes up through this covering into the great roof space and thence to the outside by ventilators in the ridge of the roof. Fresh air is supplied from the great barn space below, through doors and perhaps more or less crevices in the partition that separates the stable from this space.

The third things we note are the necessities of these farmers. As a class they are tenants, and have to pay an annual rent to their landlords of from $10 to $20 an acre on their holdings. Their cows must be rent payers. They cannot afford to keep a single cow at a loss, as our farmers sometimes do. In their system of management the cows must be made profitable, both in the products of milk and the products of flesh. When I was a young man I worked for a dairy farmer who held that some dairy cows could be profitably fatted for beef and others could not be thus profitably fatted; and that the difference lay in the fact that the one class deposited fat largely around the kidneys and on the intestines, the other largely on the ribs and in the interstices of the muscles, I do not know that this



BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the **Buhl Factory, "Improved Elgin" and Genuine Iowa Cans**; superior material, design, workmanship and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

Milk Condensing Machine

I supply the most improved machinery and most successful processes for manufacturing all classes of condensed milk and evaporated cream. Factories built complete, put in operation and results guaranteed. If you are interested write for my new illustrated and descriptive catalogue. The only catalogue ever published on the subject.

R. R. ROGERS, Winthrop, Maine.

theory is correct, but I venture it as a hypothesis to explain the success of these Friesian dairymen.

Lastly, a few minor features are worthy of note. Among these are the bull shows held in the springtime in almost every village and the cow markets held weekly or bi-weekly in the principal towns and villages. Both are fostered by the local governments. The former are designed to educate the farmers in the best types of bulls and to enable them to select and purchase such as are suitable for their herds. There is no display about these shows and no holiday excitement. They are for business. The same may be said of the cow markets, yet I doubt if a finer display of cows has ever been seen at any of our World's Fairs than are shown every week at some of the market places. In order to give a correct impression of the influence of these markets on the development of the breed, I will describe the one at Leuwarden, the shire town or capital of Friesland. The market ground occupies from four to six acres. Here on every Friday may be seen from two hundred to four hundred cows, nicely groomed and in fine condition, the great majority in milk. They are such as the farmers themselves in the surrounding districts have selected from their herds to sell. The probabilities are that they are not as great milkers as they desire to keep. Here are buyers from Germany, South Holland, Belgium and probably France. Every convenience for shipping is provided. Probably, the majority are sold. Of course some will return to their own pastures or stables and be brought on the next market day. Thus a constant sifting process goes on. With rare exceptions they do not keep cows beyond six years old. Thus it will be seen that their herds are constantly renewed by the offspring of cows in their prime.

Before leaving this part of my subject, I hope it will not be regarded out of place to refer to the productiveness of these cattle in the province of Friesland. In 1874, before oleomargarine was known, England imported from this province 40,763 hundredweight of cheese and 266,041 hundredweight of butter. I quote these figures from Chambers' Encyclopedia. The area of this province is 1,253 square miles, about that of Herkimer county, in this state. In 1879 a census of cows was taken and found to be 144,802. If there was a like number in 1874, England's importation of butter from that province that year, averaged 204¾ pounds to every cow of whatever age or condition.

Slow Churning—Cream Ripening..

ED. HOARD'S DAIRYMAN:—Have read an account of slow churning of cream on page 946, while perusing the DAIRYMAN for information on that subject, but would like to have your opinion as to my trouble.

I keep my cream 3, 4 or 5 days according to the amount of cream gathered, daily, before churning, and it generally is just about sour enough to churn in from 30 to 50 minutes, but to-day I could not bring the fat globules in contact, it came to a granular form and regardless of agitation would not separate. I use a float glass thermometer and cream registered 60 degrees.

Do you think freezing would have that effect? Cream room got cold one night, just low enough to start a scum of frost on cans, otherwise the temperature of cream averaged about 40 degrees. That is too low a temperature for fermentation, consequently the want of acid in cream. That is about the cause, is it not? H. T.

Wausaukee, Wis.

Butter fat melts at about 91 degrees Fah. and softens some distance below that point. It makes quite a difference in the physical properties of the fat globule whether it has been cooled down to 60 degrees from near the melting point or warmed up to 60 degrees from near the freezing point. In the first place, the fat globule only becomes hard after several hours standing, and in the second condition it remains hard even when heated to some distance above 60 degrees. The second fact probably accounts for your poor churning.

Cream kept at 40 degrees will not ripen properly; it is too low for the lactic acid bacteria to grow, while the bitter varieties grow rapidly. The cream should be heated to 60–65 degrees for ripening and churning also.

A Barn and Stable Inquiry.

ED. HOARD'S DAIRYMAN:—I am going to appeal to you for some information and also for a decision.

I have moved onto a ranch for a period of five years, where the cow accommodations are very inadequate. One of my friends tells me to remodel the old barn, 72×90 on the following plan: Dig a good ditch 1 ft. deep and 1 ft. wide at northwest corner going down to 2 ft. at southeast corner with a good fall to carry the water away (which I have) and use the dirt to level up the inside of the barn; then fill ditch up with pieces of split cedar by making a good bottom out of the cedar. Put a scaffold up 8 ft. from the ground (no floor in barn) and cover same with pieces of split cedar and let the cows have the lower part for a place to run in during the winter. Is it a good plan to have the cattle under the hay without a tight floor over head? Will the odors arising from those cows spoil lots of the under part of the hay?

Now, I can build new and just to suit me and have it dry and clean and lots warmer than the old barn can possibly be made, that will hold 20 cows, for about $125 outside of my own work, that is, for cash out-lay. Would such a place to keep cows as I am advised to fix up, be too dark and damp? The barn as it now stands has no way to get sunlight or daylight. With such an arrangement as described would I not be ahead more than 8 per cent on the investment (legal rate here) by building new? The old barn is of the old post style and no shape or room to put anything but hay.

Napavine, Wash. UMPQUA.

If certain that the new stable can be erected at no greater expense than stated we quite agree with our correspondent that it would be money well invested. It is a pretty difficult matter to remodel an old house or barn and make it satisfactory, without costing nearly or quite as much as to build entirely new.

In this view of the situation it seems to be unnecessary to consider the other questions submitted.

How Much Oil Meal.

How much oil meal can be fed per day without any bad effect, or can you feed it as a full grain ration to milch cows? G. R.

Leon, Wis.

It has not, to our knowledge, been accurately determined just how much oil meal could be fed without injury to the cow, but as a rule it is not usually profitable to feed more than 2 to 3 lbs. daily. More than this would also be liable to give the milk, and particularly the butter, an oily character and flavor.

"ADVERTISEMENT."

GIVES "GO"

Food That Carries One Along.

It's nice to know of food that not only tastes delicious but that puts the snap and go into one and supplies staying power for the day.

A woman says: "I have taken enough medicine in my time to furnish a drug store but in later and wiser years I have taken none but have depended, for the health I now enjoy, on suitable and sustaining food of which I keep on hand a tested variety, plain but nourishing.

"Of these my main dependence is Grape-Nuts, especially if I have before me a day of unusual effort either mental or physical. In this case I fortify myself the first thing in the morning with about 4 teaspoonfuls of Grape-Nuts moistened with cream and not much else for breakfast and the amount of work I can then carry through successfully without fatigue or exhaustion is a wonder to those about me and even to myself.

"Grape-Nuts food is certainly a wonderful strengthener and is not a stimulant for there is no reaction afterwards but it is sustaining and strengthening as I have proved by long experience." Name given by Postum Co., Battle Creek, Mich.

There's a reason four teaspoonfuls of Grape-Nuts and cream will add more strength and carry one further than a plateful of coarse heavy food that is nearly all waste. Grape-Nuts food is condensed, pre-digested and delicious. It contains the parts of the Wheat and Barley grains that supply the rebuilding parts for Brain and Nerve Centres.

Look in each package for a copy of the famous little book, "The Road to Wellville."

EMPIRE

There is no royal road to success, but there are roads which are harder than others. There is no way to make money out of dairying without work, but there are ways easier than others. The EMPIRE way is the easy way. It is the way to make the most profit with the least labor and the least expense. It is the most satisfactory way. The EMPIRE Cream Separator is the easy machine to operate and the most profitable machine to use. It is easy to buy because the increased profits pay for it. It is easy to operate because of its simple construction. Our book tells about the EMPIRE way of dairying and about the EMPIRE Cream Separator. It is free for the asking.

Empire Cream Separator Company,

Main Office **Bloomfield, N. J.**

Western Office **Chicago, Ills.**

The New 1903 REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

A. H. REID, 30th and Market Sts., Philadelphia, Pa.

Cream Separator Talk

can be made strongly persuasive, but it's only talk after all. The Thing that satisfies is trying at your home. The

AMERICAN

is sold on trial. It's the separator that makes its own way. No obligations to buy it if you shouldn't be pleased. The price is right. If you want to try it with a view to buying, say so. The catalogue is mailed free. Write for it.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

AS IT IS IN INDIANA.

C. P. Goodrich took a cow census at Plymouth, Ind., a few weeks since of 50 farmers patrons of a creamery. Note the following facts: The total number of cows was 250: the average cost of keeping per cow was $24.96; the average returns in butter fat per cow was $32.20; the average number of pounds of butter fat per cow was only 166; the average net price was 19.4 cents: the average net profit per cow above cost of feed was $7.24; the average returns for $1 worth of fead was $1.29. The six patrons who read a dairy paper averaged $21 per cow over and above the cost of feed, while the 44 who did not read a dairy paper received only $5.58 per cow above the cost of feed. Does it pay to go without sound dairy reading?

COMING EVENTS.

Ohio Dairymen's Association, Columbus, Jan. 27-29, 1904.

Massachusetts Creamery Association, Greenfield.

Connecticut Dairymen's Association, Hartford. Jan. 20-21.

Wisconsin Buttermakers' Meeting, Eau Claire, Feb. 2-4, 1904.

Wisconsin Dairymen's Convention at Platteville, Feb. 10–12, 1904.

A WRITER in the *Tribune Farmer* says in reply to the inquiry, "Why don't you veal your calves at 5 weeks old instead of selling them at 4 days old and save a month's hand milking?" replies; "My neighbor kept two calves until 5 weeks old, giving them all the milk from two cows, and the calves sold at $3 each. A while ago a calf was dropped in my stable and was sold at 4 days old for $4. In the last thirty days its mother has produced 900 pounds of milk that has brought me $10.80, which plus the calf, makes $14.80. That's why."

COST OF MAKING CREAMERY BUTTER.

The Iowa Dairy Commissioner found after an extended investigation that the cost of making creamery butter, including all expense except hauling of milk, freight to market, and commission, varied from 1.2 to 6 cents a pound. These two extremes were found in co-operative creameries.

The lowest cost was in a creamery making a half-million pounds; the highest in a co-operative creamery making less than 30,000 pounds annually. Here is a profitable fact for all dairy farmers to consider. There is a great tendency among them to split up into small creameries to avoid hauling the milk a long distance, or because of some dissatisfaction or other. It should be remembered always, that the small creamery or cheese factory is a very costly luxury, one that must be paid for in an increased cost for making.

The following scale of cost was established by the Iowa Commissioner:

In creameries making:	
Not more than 50,000 pounds	3.14c
Between 50,000 and 100,000 pounds	2.36c
Between 100,000 and 150,000 pounds	1.99c
Between 150,000 and 200,000 pounds	1.78c
Between 200,000 and 300,000 pounds	1.71c
For the State	2.28c
Average for first and second classes	2.22c

THE WELL POSTED PRACTICAL MAN.

In every walk of life there are three kinds of men: the man who is all theory, who carries in his mind a picture of what he wants, but who never quite trains his constructive faculties to the task of doing the thing. Such men are like the artist who loved pictures, but who had never acquired the skill to paint one. Then there is the man who knows nothing more about anything, than what he has learned in trying in a rude way to do it.

Finally, comes the more perfect man, who has studied the theory of the thing, the laws and principles that govern it, as best he can, and besides, has tried to learn the best way of doing it.

The effort and purpose of all the agricultural agitation and education we see going on nowadays, is to produce more farmers of the last class. No man can be truly practical unless he knows the theory as well as the practice of things.

Just at present, the dairy industry is greatly in need of truly scientific as well as practical breeders of dairy cattle. So much of this work is done either with both eyes shut, or else with only one eye, that of wild theory, or narrow visioned practice.

A few years ago, we had the pleasure of a few hours' study in the Jersey herd of Mr. F. A. Dawley, of Fayetteville, N. Y., who is also Superintendent of the New York Farm Institutes. Mr. Dawley took this herd a few years since, and being a well posted farmer as well as thoroughly practical in his ideas, set to work to see what he could do at the task of developing the dairy capacity of his cows. He has at the same time developed his ideas, judgment and capacity of understanding, for he is a hard student. The result is that he now has a herd of registered Jerseys that are remarkably rich in prepotent dairy capacity. He has not been a dreamer, nor either a blind manipulator of breeding forces. Mr. Dawley represents very forcibly the third class of farmers we speak of, a class altogether too few in numbers, who combine the student of theories with the close practical constructionist. Every breed of dairy cattle is suffering today because there are not more breeders of precisely this character.

HARDLY A WISE STATEMENT.

In explaining the rules which have been adopted governing the Dairy Cattle Test at the St. Louis World's Fair, Mr. J. J. Richardson, Chairman of the Jersey Cattle Committee, says:

"The dairy demonstration to be conducted during the World's Fair will be largely in the interest of the dairy farmer who makes a specialty of furnishing his critical customers, butter of the highest quality, fresh, sweet, and high flavored—a product that excels in aroma, grain and palatability—and is *seldom seen in the open market.*" (The italics are ours.—ED. DAIRYMAN.)

This looks to us like an unwise admission. It is tantamount to saying that the great mass of dairymen who furnish milk to creameries and cheese factories, and whose favorable opinion concerning Jersey cattle should be sought after by Jersey breeders, are of no account whatever. The class Mr. Richardson mentions constitutes a very small minority, as his statement "seldom seen on the open market" clearly indicates.

Then besides, the statement is not exactly true. This dairy demonstration is entered into by Jersey breeders for the great central purpose of demonstrating the superior dairy qualities of their cattle from an economical and commercial standpoint. Such a purpose is indeed a worthy one if the procedure be along just and reasonable lines.

The private butter makers need no special demonstration or test on their behalf. They are at the top of the ladder already, and of all dairymen know best what they are about. But the great commonalty of dairy farmers do need all that such a test can teach them. And what is more, the Jersey cattle breeders need very badly a wider appreciation of their cattle.

A prejudice against the Jersey cow has been growing among the great mass of farmers. In this we believe they are governed by notions like that of size, meat production, etc., which are not sound or economic from a dairy standpoint. No more economic butter producer exists than a good Jersey cow. But the average farmer is not an economic man to start with, and it is no wonder that he should be misled in his judgment concerning true economy in dairy farming, or the kind of a cow that is most economical.

The purpose of this World's Fair cow demonstration should be to make friends for the Jersey cow among the millions, where she most sorely needs friends.

The Large versus the Small Dairy Cow.

Another View of the Facts.

ED. HOARD'S DAIRYMAN:—I have read very carefully and with much interest Mr. Gardner's communication on page 1096, in which he reviews Bulletin 102 of the Wisconsin Experiment Station, and quotes from it at some length in an endeavor to show that his favorite breed of cows is far and away superior to the other dairy breeds represented in that herd. Not differing from the average enthusiast, Mr. Gardner seems to have eyes only for those words and figures which suit his particular purpose, ignoring whatever does not contribute thereto.

Now, it is daily experience that it sometimes takes a great many views of an object, or a subject, to see all sides of it and arrive at correct conclusions. For example, taking the table incorporated in Mr. Gardner's communication, it appears that the Holstein cows consumed annually $45.46 worth of feed, for which, they return in value of product, as valued at the station, $2.07 for every dollar spent in food.

The Jerseys consumed annually $35.22 worth of feed, for which they returned in worth of product $2.19 for every dollar spent in feed. The Guernseys consumed $37.37 worth of feed annually for which they returned $2.20 for every dollar spent in feed. Now the cost of dairy products lies in cost of feed, labor and care. Included in care is the cost of stabling, bedding, etc.

It is fair to suppose that the cost of labor and care was about the same in all three of the breeds, but when it came to the cost of feed, the case was different.

Now if the farmer sold 500 dollars worth of feed to those Station Holsteins at the above rate they would have returned $1,035, which is a first-class return. If he had sold the same value of feed to the Jerseys, they would have returned $1,095—just 12 per cent more on the investment. If he had sold the same value of feed to the Guernseys, they would have returned $1,100.

These deductions should convince the farmer of the value of not being hastily drawn off from a full survey of all the facts in the case, for he may be sure that in the end the facts will make themselves felt in his pocket.

It is too true, as Mr. Gardner says, that "the Jersey list" (at the Wisconsin Station), "reads like a column of obituary notices," but it is also true that a record of this kind for Jerseys is wholly exceptional, for it is common knowledge that no breed of cows, whether of beef or dairy type, can show a larger proportion of animals, 12 years old or over, in perfect health and vigor and returning handsome annual profits to their owners.

Waukesha, Wis. X.

Honor to Whom Honor.

ED. HOARD'S DAIRYMAN:—In all the farm literature I have been deeply interested in, nothing has more impressed me than the patrons' investigations and their summaries in HOARD'S DAIRYMAN. What can be truer than truth, and these investigations give us the truth. Just as they are in every day life, their simplest acts of daily toil are (unknown to these actors in life's drama) suddenly stereotyped and held up before each one, an unexpected but exact picture of the activity of each one, pointing to himself his value as a man, to himself and to his fellowman.

Not being impersonated, however, the examples are held up before each one with the query mark attached: "Where do I belong, does my activity stamp me as a man who through well directed energy makes each dollar expended for feed return me to $2.34, or does it not even recoup itself? Burns wrote: "O wad some power the giftie gie us to see oursel's as ithers see us," but had he lived to read HOARD'S DAIRYMAN I believe he would have modified his prayer to read, that his desire was to see a strict investigation, showing him if in daily toil, in homelife, and in spiritual matters, he was achieving a plus or miserably shrinking off with a minus.

Last year's investigation gave me the text for a "talk" I was called upon to give at a farmers' meeting at Snohomish City. I was extremely fortunate; a lady teacher in one of Dakota's universities, had just thrilled us by her remarks on "Domestic Economy," when it came my turn to take the rostrum, and discuss some questious on "Bovine Economy." As I reviewed the incidents in this patrons' investigation, I could not help but couple the laws and rules that govern this bovine economy as being identical and in harmony with those that govern domestic economy.

Feeling as only woman can for her sister—and especially the woman whose sympathies elevate her mind to the point that as a teacher *i. e.* student observer of domestic economy, she actually engages in removing the cause of suffering for all women. Mrs. Heath told us the pathetic story of the child wife of the farmer with the —69 cents profit on his activities; how she craved a blue dress and worked and starved and slaved only to obtain it, when—though in mind a child wife—her haggard form and whitened hair, made the dress an anomaly. The vivid picture before us—alas! too common an occurrence—I could combine cause and effect, and prove to my hearers that, though the $2.37 man may possibly not buy the dress in time, it is absolutely impossible that the —69-cent man ever can do so. Ignorant, slavish waste of energy in barn yard and field, leaves the home with a minus 69 point father, and the United States with a minus 69 point citizen. Wake up dairymen of all states and nations! minus 69 points, still leaves you a detriment to yourself, your family, humanity. As you need thought in your work, you need independent thought in your domestic life, and in your political life. "Let the dead past bury its dead. Act, act in the living present, heart pulsating with new life derived from acquired knowledge within, and God o'erhead."

Mr. J. F. Littooy, our energetic County Horticultural Inspector was at the meeting last year, and recently asked me to give him those data to assist him in compiling his papers for the meeting of the Interstate Fruit Growers' Association, at Spokane. He will have both numbers, and will use them to prove that the farmer must specialize. Intensive methods are a necessity, the law of cause and effect must be grasped, and the individual must become a pronounced and certain entity, able to take his place beside his

fellow man, certainly not above him, and not less certainly, not below him.

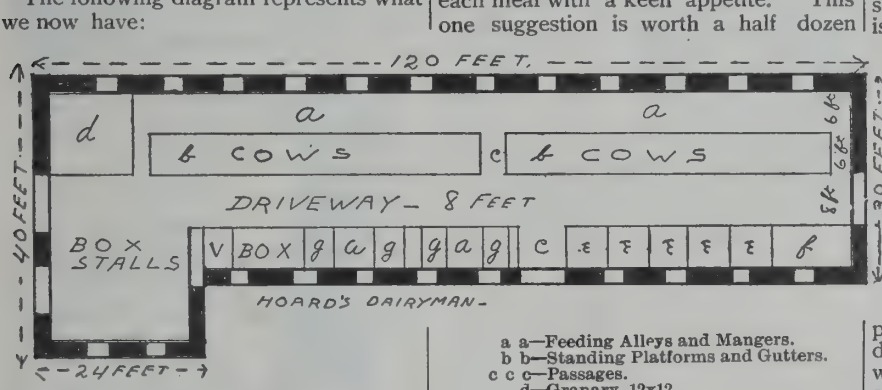
Independent men and women can live side by side, harmoniously; dependent ones nurse jealousies, create envy, malice, and all uncharitableness and have strife and bickering with them always, for says James "where there is disorder(lack of system resulting from ignorance of organic law) there is strife and every vile thing."

Brother dairymen, let us take the tip from these investigations, and in every branch of economy keep tab on our movements. We may think we are pretty good looking fellows, but when Hoard holds his mirror before us, our actual value to the world, dairy or otherwise, is made known to us without varnish. The only way to avoid an ugly picture is by being your own critic and investigator; of course you can not then see how your record compares with that of your fellowman, but you do know whether you stand on the credit or debit side of the ledger.

The mind makes the cows give a surplus over food received; it is thought then that counts; learn to think straight therefore; it is an absolute necessity in every line of your individuality, thus only being able to aspire to the time when we shall "owe no man anything but love"(the desire of the highest good to yourself,to all men.)

Yours for a conscious walk,

DANIEL F. BOISSEVAIN.



Hartford, Wash.

A Stable Plan and Queries.

ED. HOARD'S DAIRYMAN:—I have had the paper a number of years, but I am just beginning to realize that the lessons you are constantly hammering on, means me. A close study of each issue of the past year, has certainly been a revelation to me.

The first thing I must have is a dairy barn. Can you help me to plan to have a stable that I will be pleased with after it is finished; also at a moderate cost?

The following diagram represents what we now have:

a a—Feeding Alleys and Mangers.
b b—Standing Platforms and Gutters.
c c c—Passages.
d—Granary, 12x12.
e e e—Double Calf Pens, 6x6.
f—Bull Stall, 6x12.
g g g g—For Yearlings.
v—Ventilator.

The above is three old sheep barns moved together, and the bank on north side just reaches top of basement wall. There are three windows on the north and five on the south side. So we find the stable dark, cold and damp. Several places in the ceiling knock my hat off.

I have three plans in mind. I could tear away the 40×24 barn (on the west) and extend new stable south from where yearlings stand and get plenty of light from east and west sides. I could shorten new stable and extend it through, and across old stable and get a good western exposure, or I could extend the calf pen on south and make a stable under the 40×24 part with much west and a little east and south exposure. In both cases cutting off the old stable with a partition.

When I was a boy, I worked on a farm that had a stable 24 ft. wide and the cattle were placed 3 and 3, heads and tails along either wall. That man allowed 3 ft for each cow, which left a 6 ft. driveway. Would the cows get as good light and ventilation as when in rows, facing out?

Could I afford to give up the driveway entirely, using an over head car, for the sake of having a full glass south end,and getting less vacant space for the animals to warm? I am a little at sea about the amount of glass, height of ceiling, shape of gutter,watering device,method of tethering, size of stable etc., but will wait until I get a little farther along for those matters. F. C.

De Ruyter, N. Y.

In our suggestion for remodling this stable,we have allowed the "three old sheep barns" to remain as at present arranged, except that they should be raised up so as to allow the basement to be fully 8 ft. high in the clear. We would not fill in this additional height by building up the stone wall, but would use frame work and studding. As 26 ft. in the clear is not sufficient for two rows of cows and a driveway, we take 12 ft. on the north side for cows, 8 ft. for driveway, and use the remaining 6 ft. for calf pens and yearlings,standing the latter"heads and tails", by twos and threes.

With the exception of providing a stairway, which cannot be located without knowing the arrangement of the upper floor,the diagram will indicate most, if not all, of the arrangements which we consider necessary.

A Holstein Record.

ED. HOARD'S DAIRYMAN:—I will send you a record of seven registered Holstein cows for the year 1903. No. lbs. milk for the year, 88,358. Amount received for calves and premiums at my home fair, $270.00, making a total of $1,153.58.

My cows are not out of the barn in all the fall, winter and spring weather. I would like to send you a cut of my barn and also my herd. W. H. S.

Lyons, Ohio.

We are always glad to receive photographs of barn buildings or anything else of practical value around the farm.

Prof. Haecker Discusses the Feeding Problem.

ED. HOARD'S DAIRYMAN:—In your answer to inquries in regard to feeding made by F. R. P., Painesville, Ohio, you touch upon a very vital point in feeding, in saying that "possibly some cows, if not all of them, will eat a little more silage or hay or both, than is specified. If so, let them have it, but bear in mind that it is better they should be a few mouthfuls short, rather than have a little more than they will care to eat. They should be so fed that they will come to each meal with a keen appetite." This one suggestion is worth a half dozen years' subscription for any dairyman, if carefully followed. Dairy bred cows properly handled should be fed to their full limit, not with meal but with roughage. To feed a cow to her full limit, is not giving her all that she will take at any one time, or what she will take for a week or ten days, but what she will take regularly from week to week and month to month,always cleaning up her box and hay rack and come to her next meal with a strong appetite. Every one of my cows clean up everything at each feeding, and would, for a few days or a week, take a pound more, but by the expiration of a week or ten days, they would begin to leave some and very likely would go off their feed and a bad break in flow of milk would follow. A cow's limit is her staying limit, not what she will take for a few days only.

If fed only to her staying limit she not only takes all the feed in the box but she licks it up clean, leaving nothing in the corners. There are some seventy odd head of cattle in the dairy barn, and an hour or so after they have been fed not a double handful of feed, roughage and grain, could be secured from the mangers. And yet, if any one of the milk cows should receive a pound more grain with its complement of roughage she would go off her feed within a fortnight. The stalls of the cows used in experimental feeding are covered with flax fiber which is covered with the heaviest jute carpeting so they have nothing they can eat except what is weighed out to them at each feed. For concentrates, half get corn, barley and oats three parts each, and oil meal one part. Half get gluten meal, barley and oats three parts each and oil meal one part. For roughage they all get corn silage that has no ears, mangels and unbleached upland prairie hay, which has no weeds or stems. A certain commission house knows just what kind of hay I have been feeding for some half dozen years, and when a carload of hay that just grades up to my requirements reaches the Minneapolis market, they know where to place it. They have learned not to send me any that does not run even.

If I should attempt to do my work with such timothy or clover as is grown on the average farm, I should be entirely at sea. Tame hays do not run uniform, because the stand is not even. Where there is a poor catch the stems are too coarse and most of it is spoiled in curing so that stock will not eat it all. Furthermore, farm hay varies greatly in composition, while wild hay is remarkably uniform.

The standard ration is 8 lbs. grain, 40 lbs. silage, 16 lbs. roots and 4 lbs. hay. This ration is adjusted to a cow whose productive powers are developed to her feeding capacity, but if she is relatively a large yielder and light feeder, she would get 8 lbs. of grain and the complement in roughage for a 7 lbs. grain ration, and if she is relatively a large feeder and light yielder, she may get 7 lbs. grain and the complement in roughage for an 8 lbs. grain ration. So, all the cows are fed meal according to their productive powers, and roughage according to their feeding capacity. Every cow gets enough feed in bulk to satisfy her, but the large producer is furnished more nutriment in her feed for a given bulk than is given the one that does light work. Some want a little more or less silage or hay than the regular order of feeding would furnish, and these minor matters are adjusted to her wants.

The feeding schedule is generally prepared in the fall, the cow's conformation being the guide. I know my cows, having raised and developed them, so the changes that have to be made are slight, and the fixed ration for the winter is generally reached by the fourth week of lactation, and from then on until spring, few, if any, changes are made. Great care is taken to bring them up to a full flow by the fourth week, and to prevent any abnormal decrease in the flow during the winter. Special attention is given to their wants and comfort. Kindness and gentle treatment are potent factors in getting a large yield. A caressing touch, now and then, and a gentle voice mean much to a cow. You can coax milk out of a cow, but you can't pound it out with a milk stool. You can draw the reins over the horse, apply the whip and make him trot or run, but you can't crack the whip over a cow and make her fill a pail with the product of motherhood and affection.

T. L. HAECKER.

Minn. Exp. Station.

Some Washington State Cows.

ED. HOARD'S DAIRYMAN:—Perhaps some of the eastern dairymen would like to know what Washington cows are doing. I have milked seven cows since last January and made butter and sold $620.05 worth of butter. This is not taking into account what we have used in a family of six, and a great deal of the time, seven.

I have sold $40.85 worth of fatted calves and have one last June calf that I am raising which I value at $25; besides, I have sold about 50 cents worth of cottage cheese a week and from 25 to 50 cents worth of buttermilk each week.

I do not keep any pigs to feed the skimmed milk to, so I feed it to the hens and have sold $197.87 worth of eggs and $56 worth of chickens during the year. Now if I give the cows credit for this, as some persons do with their pigs, I think they have made a pretty good record for the year.

I am feeding corn fodder, timothy and clover hay and oat hay and alfalfa and four bushels of carrots a day. Bran and shorts are too high to feed, or I think I could made them do better than they did. A. E.

Spokane, Wash.

Michigan Agricultural College Creamery Course.

The special creamery course at the Michigan Agricultural college opened January 5, with an attendance of 33 experienced buttermakers. The butter making and milk testing are in immediate charge of John Michels who is assisted in the creamery room by the "crack" buttermaker, John Sollie, of New Sweden, Minn. and E. J. Kneibehler, of Badaxe, Mich. and by H. N. Hornbeck in the testing room. There are also two competent men engaged to teach the subject of creamery mechanics.

The advanced course in creamery butter making opens February 16 and continues six weeks. A good attendance is assured in this course. Pasteurized butter making, starters, creamery construction, advanced creamery mechanics and advanced dairy bacteriology, will be chief features of this course.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

An Illinois Ration.

Please formulate for me a daily balanced ration from the following feeds for cows weighing about 1,100 lbs.: wheat bran, oil meal, crushed corn, with plenty of alfalfa and cow pea hay. Also a ration composed of the above feeds with 35 or 40 lbs. of corn ensilage. How much more milk should I expect by adding ensilage? Cows are giving 35 pounds of milk. Success to the DAIRYMAN. J. E. S.

Carlyle, Ill,

Every ration is a daily ration. That is to say, a ration is the total allowance of feed for 24 hours. It is therefore a misuse of the word to speak of a morning ration, or a grain ration, or a silage ration.

The proper complement to roughage consisting exclusively of alfalfa and cow pea hay, would be crushed corn, were it not for the fact that corn is too concentrated to be fed undiluted. If it is convenient to chaff some of the alfalfa hay, so that it could be mixed with the crushed corn, there would be no necessity for looking for other feed, and then a daily allowance of 10 pounds each of the alfalfa hay and cow pea hay, and 8 lbs. of crushed corn, and 3 to 4 ounces of salt,would be ample for these large cows, yielding 35 pounds of 4 per cent milk daily. If not convenient to chaff hay for this purpose, recourse must be had to bran to dilute, or, as we sometimes say, extend, the crushed corn. Equal parts by measure of the crushed corn and bran, and 8 lbs. per day would not be far from right.

With a daily allowance of 40 pounds of corn silage, 12 lbs. of the hay could be withdrawn. In that event, we should not so much expect any marked increase in the daily yield of milk, as we should a decrease in cost and less shrinkage.

Scales for Cream Testing.

Will you please tell me where I can buy scales to weigh samples of cream in testing? Bassett, Neb. R. A. A.

They can be obtained from any of the dairy supply houses that advertise in the DAIRYMAN.

An Excellent Record—A Monthly Income of $12 per Cow.

I send you statement of my little herd of registered Holstein-Friesian cows for Dec., 03. I have 8 cows in milk; 1 is 11 years old, 2 are 4 years old, and 5 are 2 years old. I drew to the milk station 6,597 lbs. milk, which at $1.44 per hundred amounts to $95, and I fed 2 calves new milk and furnished two families, making over 700 pounds more. Average test at the milk station was 4.20 per cent butter fat. They came fresh from Aug. 30 to Nov. 17 and were fed ensilage 2 feeds, mixed clover and timothy hay at noon, and 6¼ pounds grain (bran and hominy feed mixed equal parts by weight), which is worth about $21 per ton. They were turned out each day for exercise and to drink in the yard near noon each day. Now do you think it would pay me to feed a narrower ration or more grain. F. M.

Smithboro, N. Y.

Thanks for the remittance, but more especially for the kindly interest shown, both in securing the additional readers and in sending the statement of the herd for December. We are more than glad to publish such reports, for they not only add variety to the contents of the paper but are object lessons of great value to other readers, which should encourage and stimulate them to do as well or better.

Where cows are making such records as are reported above, we should hesitate to make very much change in the feed. Possibly, an increase in the allowance of grain might bring some increase in yield, but perhaps no greater net profit. It would be a very wise thing to do to commence at once keeping a daily record of each cow's performance and from this get some guidance as to the amount to be fed to each cow.

Caustic for Dehorning.—Will It Pay to Feed $14 Bran?

I would like to ask just how you use caustic and at what age, on calves for dehorning. Farmers here say that the pain is excessive and sores are formed and often stunted horns grow.

Will it pay me to feed $14 bran to milch cows when butter is 20 cents. Alfalfa and timothy deteriorated on account of wet summer. I feed ear corn and hay. G. L. G.
Mission Hill, S. D.

1. It would be one answer to the first question to say that the Editors of HOARD'S DAIRYMAN do not use caustic or any other means for preventing or removing horns. Those who do use caustic for preventing the growth of horns apply it just as soon as the nascent horn shows its location, by clipping the hair from the little protuberance, dipping the end of the stick in water and rubbing on the spot and nowhere else. If done pretty thoroughly and in proper time a single application suffices, but otherwise a second "rubbing" as soon as the first has dried, is recommended. This will, of course, make more or less of a sore, but it is claimed not to be very serious or painful.

2. It will depend very much upon the kind of cows and the general treatment they receive whether it will pay to feed them bran at $14 a ton. or even ear corn and hay. If the cows are worth keeping at all we think it will surely pay to feed them some bran daily. Moreover, feeding bran to cows, carefully saving the manure and applying it to the land, is a cheap and excellent way to keep up the fertility of the soil.

A Nurse Crop to Balance Silage.

We have 20 acres of good land that we wish to seed down next year, and we want the nurse crop to balance a ration of corn silage for cows. We have been thinking of oat hay, but the protein is too low. Soy beans have failed us, what about cow peas? G. H. R.
Williamsburg, Iowa.

We are apprehensive that it will be difficult to secure a satisfactory catch of grass or clover and at the same time on the same land raise a paying crop of cow peas. Indeed, it may be doubtful whether it would be advisable to devote so large an acreage to cow peas, unless they have been tried and proven adapted to the soil and climate of that locality. Our preference would be to devote 5 to 10 acres to alfalfa without any nurse crop, or at most a very thin seeding to barley. We should expect a moderate amount of first-class alfalfa hay the first season, if the weather conditions prove to be favorable, and this would furnish the best possible complement to silage. If only 5 acres are devoted to alfalfa, let at least 5 other acres be seeded to clover in much the same way. Then try cow peas, and if they smother the young grass or clover, there will probably be a fair yield of first-class hay.

Cream and Milk.

A gentleman made the following statement: "You may tell your dairyman that at least 5% of the cows' milk he gives you must be cream. The presence of less than that amount indicates adulteration."

Another man as positively asserted that the statement was wrong. They finally agreed to have HOARD'S DAIRYMAN settle the question for them. Now, Mr. Editor, will you kindly settle the question very plainly for us.

In using the Babcock milk tester we talk about a cow giving 5% butter fat. Is that 5% butter fat what we would call 5% cream? An answer through the DAIRYMAN'S columns will be highly appreciated by us.

The DAIRYMAN has been our only teacher for many years. We have made fancy butter for fancy trade a good many years, and all our knowledge is due to DAIRYMAN'S teachings. When DAIRYMAN asserts a thing, it's so, and no dodging. R. E. K.
Mercer Co., Pa.

Milk that will not show more than 5 per cent of cream must be accounted very inferior milk indeed. It is but fair to say, however, that milk that has been stirred for cooling and afterwards more or less agitated in transportation does not throw up its cream very readily or exhaustively, and for this reason the "show" of cream becomes a very misleading indication of the quality of the milk. Moreover, cream itself is exceedingly variable. After standing a few hours milk may show 20 to 25 per cent cream, and in a few hours more there will be apparently much less cream, because of a more thorough separation of the fat from the milk serum.

One hundred pounds of 5 per cent milk would yield 25 lbs. (25 per cent) of 20 per cent cream.

The Average Cow—Which Butter Keeps Better?

About how many pounds of milk does the average cow give in one day? Which will keep longer, butter made from sweet cream or sour cream? D. E. R.
Platteville, Wis.

The first question suggests another query, which is: When will the keeper of cows learn that in considering the yield of a cow the quality of the milk is quite as important as its quantity. Creamery records show that very few herds average more than 20 pounds per cow daily, and this would be a good showing if the milk tested 5 per cent fat, but a poor showing if it tested only 3 per cent fat.

The second question is not very important as there is so little demand for butter made from sweet cream. It may be answered, however, by saying that all other things being equal the butter from sour cream should keep the longer.

Estimating Weight of Cows by Girth.

Would you please tell me the number of the DAIRYMAN that had an article to estimate the weight of a cow by measuring the girth?
Cincinati, Ohio. H. S. H.

We do not know of any article of this nature that has been published in the DAIRYMAN.

Character of Droppings.—A New Jersey Ration.

Can someone tell me through your columns how soft the droppings from dairy cows should be to get the best results in milk and health of the animals?

Please formulate a ration for fresh cows giving from 28 to 40 lbs. per day, from wet beer grains, $5.50 per ton; buckwheat bran, $18.00; corn and cob meal, $22.00; clover hay, $13.00.
Bernardsville, N. J. G. W. T.

We doubt whether anyone can give a specific answer to the first question. They should be neither liquid nor dry, not so soft as to lose all shape, nor so hard as to remain lumpy,—just a healthy medium, would be our reply.

When it is remembered that milk is a product from the feed consumed, over and above that portion devoted to the maintenance of the animal body, it becomes apparent that the cow yielding 40 lbs. of milk daily requires more feed than one yielding 28 lbs. The revised feeding standards published by us on page 1014 of the current volume may be used as an index of the different amounts of nutrients required, when the live weight of the animal and the quantity and quality of the daily yield of milk are taken into consideration.

At a venture, we should suggest that a good average allowance for a herd of the character mentioned would be 16 lbs. of clover hay, 30 lbs. wet grains, and 5 lbs. corn and cob meal. This would be more than the 28-lb. cows could profitably use and less than the 40-lb. cows would require.

A Wisconsin Ration.

Please give me a balanced ration for cows nearly fresh. Have good clover and timothy hay. Corn is 50 cents; barley 50 cents; oats 30c; oil meal $1.40 per 100 pounds; wheat bran $19 a ton.

I like your valuable paper and wish you good success this year. C. R.
Livingston, Wis.

It is probable that a daily allowance of 20 lbs. clover and timothy hay, 2 lbs. each of corn, barley and oats and 1 lb. of oil meal, will suffice as an average ration for these cows. It is indispensable, however, if one wants to feed to best profit, that he should know just what each cow is doing and is capable of doing, and the only way to obtain this knowledge is to weigh the milk daily and test it frequently and then study the table on page 1014. With such knowledge in hand it will unquestionably be found that some of the cows are not entitled to the amount of grain specified above, because they cannot make good use of it, and that others deserve more.

Crops for Next Season.

Since I am about to lay my plans for next summer's catch crops and hay crops and feel that I can look to no better authority than HOARD'S DAIRYMAN, I make following inquiries: Will you please tell me how much oat hay or pea and oat hay I may expect in tons from an acre of prairie soil; how it compares with clover and cut corn stover as a feed for milch cows and young heifers; how much seed should be used of each, as above named. Will the Canada field pea do well in the vicinity of Hebron Pairie, Mc Henry Co., Ill? Some have expressed a fear that as sweet corn does not do well on the prairie soil, peas would not. Please give your idea about this. I would be glad if some dairymen would give their experience as to soiling crops and legumes as hay crops for milch cows.

I inclose a list of subscribers for the coming year and hope the parties will find as much good in the DAIRYMAN as I do. If so they will be stayers. R. R. R.
Walworth, Wis.

The amount of oat and pea hay that can be produced will depend somewhat upon the season, but more and principally upon the soil and cultivation. Some portions of the prairies in northern Illinois have been cropped pretty near to exhaustion. Corn and oats and hay have been raised year after year and nothing returned to the land—and especially nothing in the line of humus. One of the results is that such soils do not retain moisture enough and long enough to dissolve the fertilizing elements that may be present, and the crop suffers from drought, or more properly starves. Plant food must be dissolved and held in solution in order to be available for plant nourishment.

Good oat and pea hay is considerably superior to common clover hay, and clear oat hay less valuable. Corn stover, of course, is much inferior to oat hay. See the table of analyses on page 772 of the current volume. The Canada field pea ought to do well in the region named, irrespective of whether sweet corn is a profitable crop, but we should be reluctant to put entire dependence upon any untried crop. Meantime try to grow clover and experiment with alfalfa. Sow some rye early next fall to be turned under in the spring. Also sow clover with all spring grain.

Starting a Creamery. Proper Handling of Milk.

I am starting a creamery on a small scale, and want to know how is the best way to manage the delivery of the milk. Would it be best to deliver twice or once a day? If delivered once, how would you do it? Would the milk have to be cooled as soon as milked and then warmed the next morning? C. L. D.
Bowling Green, Ky.

Milk is seldom or never delivered to northern creameries oftener than once a day. The milk producer is required to take such care of the night's milk that it will come to the creamery next morning in good condition and perfectly sweet. This is done (usually) by setting the can containing the milk in a tub of cold water and giving it an occasional stirring while the milk is cooling. It is important not to mix the warm morning's milk with the cooled night's milk, but if both must be transported in the same can, the morning's milk should be cooled before adding it to the night's milk. On arrival at the creamery, the milk first of all goes into the common vat with other milk and from there passes through a heater on its way to the separator.

A Pennsylvania Ration.

Will you please formulate for me a ration from the following feeds: Corn ensilage, not quite mature, oats and pea hay, some timothy and red top mixed hay. Corn meal, $23: corn and oat feed, $23; winter bran, $20; brown middlings, $20; red dog flour, $26; white hominy feed, $24; colonial middlings, $24; buckwheat middlings, $23: Biles, XXXX dried distillers grains, $25; ration to be for milk. Cows are Jerseys, some grades and weighing from 700 to 900 lbs. C. F. J.
Wapwallopen, Pa.

Without disparagement to the other feeds named, we should be inclined to select common bran and buckwheat middlings, and feed daily from 3 to 4 lbs. of

"ADVERTISEMENT."

MINER HIT

A Gold Miner on the Coffee Question.

Many a rugged constitution has broken down by use of coffee:

"I and my son are miners and have been strong coffee drinkers. I will add I followed mining for fifty years. Nearly three years ago my son had palpitation of the heart so bad that after a hard day's work he would be almost unable to get his breath when lying down, and I was a victim of constipation, headache and could not sleep soundly.

"So I pulled up stakes one day and started to see a doctor and curiously enough an old acquaintance I met on the way steered me off. We stopped and talked and told each other all the news and I told him about our troubles. He said it was coffee doing the work and that using Postum in place of coffee cured him of almost exactly the ailments I described.

"So instead of going to the doctor's I sent for some Postum although I did not have much faith in it but to my great joy it turned out all right and after we quit coffee completely we both began to get well, kept it up and are now both of us strong well men with none of the old troubles. A miner is supposed to be able to stand great hardships but we could not stand coffee. It was killing us. Anyone followlng the directions on the package of Postum will have a far better drink than he can get from the best coffee.

"I think every coffee toper should know Postum will cure him of his ailments, besides it is such a refreshing drink." Name given by Postum Co., Battle Creek, Mich.

Coffee hurts nearly all who drink it and soaks some people very hard. There is a sure way out of the trouble by quitting coffee and using Postum.

And "there's a reason."

Look in each package for a copy of the famous little book, "The Road to Wellville."

5 + 1 = 6

A No. 1 National Cream Separator will give as much cream from *five* cows, as old setting methods, or cheap separators will get from *six*. If you own five cows and are thinking of buying another, it would be true economy to purchase a No. 1 National instead. It reduces labor, saves time and increases profits. Capacity 375 lbs. an hour, or about 10 gals. every 15 minutes. Runs lightly and easily cleaned. Simple construction and few parts is the secret.

NATIONAL Cream Separators

are made for every day use, *and meet every demand of the practical user.* The price of the No. 1 National is $85. Impossible to get as good for less, or a better for more. Send for free booklet No. 80. It tells facts you'll be glad to know. *Write to-day.*

"Grandfather Traded With Us"

One of the greatest joys of this great business is the many kind letters we receive daily from our customers, expressing their pleasure and satisfaction with our goods and methods.

Often the most significant part of the letter is embodied in the few words: "My grandfather traded with you years ago." It is the complete confidence of our customers in our honesty, born of past experience in dealing here, that enables us to hold their continued trade.

One-time special "below cost offerings" to catch an occasional customer, and making up the loss on subsequent orders, would never build a business like ours.

It is the constant saving and steady stream of pleasant business relations which makes our patrons eager to speak a good word for us at every opportunity.

Our prices are 15 to 50 per cent below regular retail figures.

We Want You to Try Us

and test for yourself our ability to please you. Tell us what kind of goods you are interested in and we will send you without charge any of the following illustrated special catalogues quoting wholesale prices. Merely mention the number of letter of the catalogue you want.

Complete satisfaction or money refunded without question.

each with 40 lbs. silage and all the oat and pea hay each cow will eat without waste. If it becomes necessary to feed red top and timothy to cows in milk, it might be desirable to add a couple of lbs. of the dried grains, or if this is inconvenient, simply increase the bran and buckwheat middlings. But the man in charge of the cows, must, after all, be the final judge of how much to feed, and he should have a daily record of the milk yielded by each cow to enable him to arrive at correct conclusions. If increasing feed does not increase the flow of milk, it is sheer folly to continue in that course.

Missing Butter Fat.

I have sort of a conundrum to ask you. During the month of July I sent to the factory 493 lbs. of cream testing 31 and 32 per cent from 2841 lbs. milk. During the month of August I sent 368 lbs. cream testing 30 per cent from 2813 lbs. of milk. We are very careful in running the separator. Can you give me an explanation in the columns of your paper? J. F. P.
Dayton, Ore.

Not being good at conundrums we are tempted to leave the above question to those who are more apt at this kind of amusement. The more so as, without any additional knowledge concerning local conditions, it would be the wildest guess work to attempt to account for the 45 lbs. of fat which are unaccounted for.

The First of Forage Plants.

An experiment made by the Nebraska Experiment Station at Lincoln, to show the comparative yields of forage plants and tame grasses proved that the yield of one cutting of alfalfa was from four to six times greater than the others. The experiment gave the yields per acre as follows: June clover, 2,365 pounds; Mammoth clover, 2,375 pounds; alsike clover, 2,066 pounds; alfalfa, first cutting, 4,080 pounds; blue grass, 2,875 pounds; orchard grass, 2,390 pounds; timothy grass 2,800 pounds; red top grass, 2,350 pounds: meadow fescue, 1,875 pounds; tall meadow oat grass, 3,000 pounds; timothy, blue grass and orchard grass together, 1,015 pounds. This gave alfalfa first place by 1,080 pounds over its nearest competitor, the oat grass, but this was only the first cutting for the alfalfa field and two cuttings followed, while the other fields were not cut the second time. With the three cuttings, and a fourth crop estimated at 1,800 pounds, the alfalfa field yielded 12,720 pounds, or six and one-half tons per acre. The next best record was a ton and a half.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

A Wisconsin Herd Record.

ED. HOARD'S DAIRYMAN:—Enclosed please find record of my grade cows for the 12 months of 1903. While the record is not the poorest or the best, it shows what can be done with an average lot of cows, by good feeding and care. Three years ago these same cows failed to pay for their feed. Their present performance is due to HOARD'S DAIRYMAN'S preaching faithfully followed. They were fed on ground barley, oats and corn, balanced with oil meal and bran, clover hay and shredded corn stover in winter, and clover pasture during the summer months, supplemented with a small amount of ground feed and bran. Milk is weighed every milking and tests taken 3 to 4 weeks apart during the year. During the winter, cream is sold to the creamery, but in the warm months the greater part is sold to ice cream makers, at Portage.

These cows are nearly all grade Brown Swiss, No. 4 being grade Guernsey, 2, 3 and 5 being grade Jersey. The barn is old and not convenient, much like barns built 25 or 20 years ago, lacking nearly all the modern cow comforts.

Portage, Wis. EDWARD O. RICE.

An Inquiry From Kansas.

ED. HOARD'S DAIRYMAN:—I have been a reader of the DAIRYMAN for about two years. I have not been a subscriber that long, however.

I keep about 20 cows and am very much interested in the columns of the DAIRYMAN, and don't see how anyone, who keeps cows, can afford to be without it. At times I find enough in a single issue to repay me for a whole year's subscription. The wonder to me is, that you can produce such a good paper, at such a marvelously low price. So allow me to congratulate you and encourage you with a few names for 1904, wishing you a prosperous and happy new year.

I also have a few questions I would like to ask since I see you are very willing to answer everything that comes in your way:

1. How is kafir corn for silage? Is it as good for that purpose as common field corn?

2. Does it make any difference what season of the year a silo is filled? Will it do as well filled in hot weather as when it is cool?

3. I wish you would give me a table to go by to get the best results, the cheapest, out of the following: bran, $18; corn chop, $20; wheat shorts or middlings, $20; prairie hay, $7; alfalfa hay, $11.

4. Can I feed alfalfa hay alone, and leave off the bran altogether, and get as good results as if I would feed some of both?

Some of my friends who can raise alfalfa, which I cannot do, hold out the idea that a cow will do just as well if all grain ration is discontinued, if alfalfa hay is fed with a liberal hand. Now this is very hard to believe, and I am not willing to swallow it unless cited by some good authority. If HOARD'S DAIRYMAN says so I'll believe it,

Now, MR. DAIRYMAN it's up to you; how about it? JAYHAWKER.

Galena, Kansas.

1. We have had no experience with kafir corn for silage, and do not now recall any report concerning it from others.

2. No difference at all, so far as we are advised.

3. See table of analyses on page 772.

4, It was maintained at the California Dairymen's Convention, last winter, that under conditions existing there it did not pay to feed grain with alfalfa hay. This is contrary to the views we have entertained. It was not contended that as much could be produced, but the extra milk obtained by feeding grain cost more than it was worth. It seems hardly possible that a cow could eat enough roughage, even if it is alfalfa hay, to enable her to do her best or most profitable work. Under the conditions mentioned by our correspondent we should be disposed to use both kinds of hay, say 10 lbs., more or less, of each, or as much as cows will eat without waste, and from 4 to 8 lbs. of a mixture, equal parts, by measure, of bran and corn chop.

Skim Milk for Poultry.

L. S. Maynard is author of the following article, which appeared in a recent issue of the *Tillamook* (Oregon) *Headlight*:"

"No condensed milk factory for me. Why? Because I can make more out of my milk. The butter made at the creamery in Fairview from April 1st to close of the year 1902, from my milk, brought me $1.11 and a fraction per hundred pounds of milk. Then I had skim milk left, and now, to come at the value of it, I must give a little of my experience.

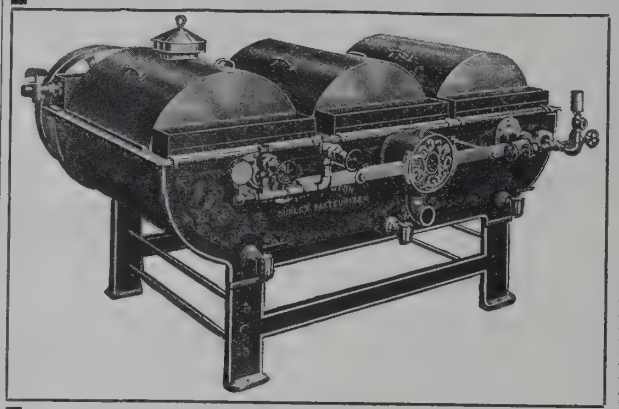
For several years I kept no pigs and raised no calves, but gave the skim milk to my hens. I charge my hens with the wheat I buy and give them credit for eggs and chicks sold. For the year 1900 they had to their credit $228 above the cost of wheat.

For 1901, I thought I would try feeding the skim milk to pigs and calves, so I bought two pigs and raised my calves. In the fall they were worth about $80. Now we will see how the hens came out. They got no milk, but they had $244 worth of wheat and had to their credit $18 above the cost of the wheat. So I said it did not pay to feed the milk to calves and pigs as well as to the hens.

So in 1902, I kept no pigs and vealed the calves at six weeks and gave the milk to the hens. Result: Fed hens $217 worth of wheat, sold $372 worth of eggs, leaving to their credit a balance of $155 against $18 the year before. Now, take the $137 difference in the hens' credit for the two years, add to that $40 for veal calves, and you have $177 for the skim milk, or over 80 cents a hundred for the skim milk, which, added to $1.11 for the whole milk, makes $1.91 per hundred pounds of milk.

Now, the condensing factory won't do

WINCHESTER



'NEW RIVAL" BLACK POWDER SHELLS.

It's the thoroughly modern and scientific system of loading and the use of only the best materials which make Winchester Factory Loaded "New Rival" Shells give better pattern, penetration and more uniform results generally than any other shells. The special paper and the Winchester patent corrugated head used in making "New Rival" shells give them strength to withstand reloading.

BE SURE TO GET WINCHESTER MAKE OF SHELLS.

Cheese—Steady; Daisies, 10¼@10½c; Twins, 10c; Young Americas, 10½c.

Eggs—Weak; at mark, cases included, 23@26c.

Cattle—Choice to fancy beeves, 1,200 lbs. up, 5.55@5.70; good to choice heavy steers, 5.90@5.50; fair to good export and shipping steers, 4.35@4.85; medium beef steers, 4.00@4.30; plain beef steers, 3.65@3.90; good to fancy heifers 3.80@4.75; good to choice feeders, 3.45@4.15; good to prime stockers and feeders, 2.00@3.30; fair to good cows and heifers, 3.00@4.00; good cutting and fair beef cows, 2.50@2.85; common to good canning cows, 1.40@2.40; bulls, poor to choice, 2.40@4.50; calves, good to fancy 3.75@6.75; calves, common to fair, 3.00@5.50; corn-fed, western steers, 4.10@5.40; Texas bulls and grass steers, 2.25@3.75; fed Texas steers, fair to choice, 3.40@4.50.

Hogs—Good to choice heavy shipping, 4.50@4.95; fair to good heavy packing, 4.50@4.70; rough and common heavy mixed, 4.35@4.65; assorted light, 150 to 195 lbs. 4.35@4.70; good to choice butcher weights, 4.70@4.90; fair to choice light mixed 4.40@4.60; thin to choice 50 to 120 lbs., 4.00@4.40; stags and rough lots, 2.75@4.30.

MILWAUKEE, Wis., Jan. 11—Butter—Creamery, extras, 24c; firsts, 21@22c; seconds, 18@19c. storage, extra, 20½@21c; storage, low grades, 15@18c; renovated (process,) 17@17½c. Dairy fancy, 17@18c; lines, fresh, 14@15c; roll, 14@15c; packing stock, 12c; whey, 8c; grease, 5@6c.

Cheese—American full cream, new: Twins, 10@10½c; Young Americas, 10½@11c; Daisies, 11@11½c; Longhorns, 11@11½c; low grades, 7@9c. Brick—New, fancy, 10@10½c; low grades, 7@9c; Limburger—New, fancy, 10@10½c; off goods, 6@8c Swiss—Drum, choice, 12@12½c; Drum No. 2, 10@11c; block, choice, 11@11½c; block, No. 2, 9@10c.

Eggs—Strictly fresh laid, loss off, cases returned, 28c; held fresh, candled, cases returned, 25c; strictly fresh laid, at mark, cases returned, 25c; storage, city, April No. 1, 25c; dirties and seconds, 20c; checks, 18c.

NEW ORLEANS, La., Jan. 8—Butter—Extras, 24½c; firsts, 22c; seconds, 19@20c.

Cheese—Young Americas, 12c; Twins, 11½c; Daisies, 12c.

Eggs—Fresh, 26c; storage, 23c.

ST. LOUIS, Mo. Jan., 9—Butter—Extras, 25c; firsts, 21c; seconds, 18c.

Cheese—Cheddars, 11½c. Young Americas 11½c; Twins, 11¼c; Daisies, 11½c; Longhorns 12c.

Eggs—Easy, 21@21½c.

KANSAS CITY, Jan. 11.—Eggs—Weak, Missouri and Kansas, cases returned, 21½c per doz; new No. 2 whitewood cases included, 22c.

PHILADELPHIA, Jan. 11—Butter—Steady, fair demand; extra western creamery, 25c; extra near-by prints, 28c.

Cheese—Steady, fair demand; New York full creams, fancy, 11¾c; choice, 11½c.

Eggs—Firm, good demand; fresh near by, 31c; at mark; fresh western, 30c at the mark.

BOSTON, Mass., Jan. 11—Butter—Creamery, western, extra, 23½@24c; western firsts, 22c; storage, 20½@23c; dairy, 15@19c; western ladle, 14@15½c; box and print 16@25c.

Cheese—Choice, 12c; Wisconsin Twins, 10@11c.

Eggs—Fancy nearby, 33c; western 31@33c; fair, to good, 28c; refrigerator, 28@29c.

TOPEKA, KANSAS, Jan. 9—Creamery—Butter 23½@24½c; Dairy butter 17½@18c.

Cheese—Longhorns, 11½c; Daisy, 11@11½c; Prints 12c.

WASHINGTON, D. C., Jan. 11—Butter—Market firm at 25 cents with light receipts.

NEWARK, N. J., Jan. 11—Butter steady at 24c.

Eggs—Steady; fresh; firsts, 29c, refrigerators, 27c.

NEW YORK, Jan. 11—Butter—Recipts, 4,966 pkgs.; firm; extra, creamery, 24c; creamery, common to choice, 15@23½c; state dairy, 15@21c; held creamery, 15@22c.

Cheese—Receipts, 3,685 pkgs; steady; state full cream, fancy, small, colored, September, 12c; late made, 10½c; small, white, 12c; late made, 10½c; large, colored, September, 12c; late made, 10½c; large, white September, 12c; late made, 10½c.

Eggs—Receipts, 5,060 pkgs; steady; state and Pennsylvania, nearby, average finest, 31c; state and Pennsylvania, seconds to firsts, 27@29c; western extras, 31c; western firsts, 29c; western seconds 27@28c; refrigerated, 24@28c.

BALTIMORE MARKET.

BALTIMORE, Jan. 7—Butter—There is little change to note in the condition of our butter market since our last report. The trading has been confined principally to the higher grades of creamery, receipts of which have been very light, and the market is kept well cleaned of all desirable offerings. There is much complaint of the very unsatisfactory quality of the current receipts; hence, there has been a better demand for fancy held creamery. Imitation creamery, when the quality is satisfactory, meets prompt sale. Ladles—The supply for the present is fully equal to the demand. Packing stock is in moderate supply and demand. Rolls—All fresh sweet lots find ready sale, but faulty stock is slighted. Blocks and prints—Choice to fancy invoices are in good demand. The general market rules steady to firm on all attractive stock.

Creamery separator, extras, 25c; firsts, 23@24c; seconds, 20@22c: Held creamery, extra, 25c; firsts, 21@22c; seconds, 18@19; imitation creamery, extras, 20c; firsts, 18@19c; seconds, 15@16c; Iowa & N. W, Ladle, extras 16½c.; firsts, 15@15½c; seconds, 13@14c; Ohio & Indiana Ladle, extras, 16c; firsts, 15c; seconds, 13@14c: Roll, Ohio, extras, 16c; firsts, 15c; seconds, 13@14c; Roll, W. Va., extras, 16c; firsts, 15c; seconds, 13@14c; Ohio Storepacked, firsts, 14c; seconds, 12@13c; W. Va. Storepacked, firsts, 14c; seconds, 12@13c; Creamery blocks (2 lbs.) extras, 26@26½c; firsts, 25@25½c; seconds, 23@24c. Creamery prints, (½ lb.), extra, 27c; firsts, 25@26c; seconds, 23@24c; Md, Va. & Penna. prints, extras, 25@26c; firsts, 23@24c; seconds, 18@22c. Renovated butter, extras, 19c; firsts, 18c; seconds, 16@17c.

Cheese—Quotations given are for late made October cheese. Fancy Septembers are bringing a full cent a pound higher.

N. Y. State Cheddars, fine, 10½@11c; choice, 9¾@10c; fair, 9@9¼c; do Flats, fine, 11@11½c; choice, 10½@10¾c; fair, 9½@10c; do Small, fine, 11½@12c; choice, 10¾@11c; fair, 10@10¼c; Ohio Flats, fine, 10@10½c; choice, 9@9¾c; fair, 8½@9c; Ohio Picnic, fine, 10½@11c; choice, 10@10¼c; fair, 9½@9¾c; Skims, fine, 8@8½c; choice, 7@7½c; fair, 4@6c; Swiss (Domestic) new, fine, 14½@15c; choice, 13@13½c; fair, 10@12c.

Eggs—With continued light receipts and quite a brisk demand for strictly fresh eggs, the market closes firm and in very good shape at 35 cents. We advise prompt and liberal shipments of fresh and good to choice storage.

301 Exchange Place. G. M. LAMB & BRO.

SAN FRANCISCO MARKET.

Jan 7—Really fancy creamery butter met with a steady demand yesterday and current offerings were well cared for at sustained prices, the favored brands being readily absorbed at the maximum quotation. With the trade practically ignoring storage stock, owing to its high price, dealers are finding little difficulty in working off consignments of the medium and cheaper quality grades of the fresh lines and are reporting the market for this latter stock in fair shape at current prices. As a whole, the local market is now in a better position than for many weeks, there being less accumulation in stores. Prices for eggs showed no further depreciation, but free supplies were obtainable at the top quotation. The cheaper grades are meeting with a lively call, as storage offerings are now light. Under excessive supplies and a slow call, the market for cheese was easier and prices receded a point.

Receipts yesterday aggregated 35,500 pounds butter, 880 cases eggs and 12,300 pounds of cheese.

Butter—Creamery, extras, 26c; good to fancy, 23@25c; dairy, extras, 22@23c; dairy, choice, 19@21c; store, 16@17c; California storage, nominal; eastern creamery, nominal.

Eggs—Ranch, selected large, 35c; good to choice, 32½@34c; store, 27@30c; California storage, 25@27½c; eastern, 25@27½.

Cheese—California creamery, mild, new, extra, 13½@13c; mild, new, choice, 12½@13c: Young, America, 13½@14½c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.

GIVES PROMISE OF GREAT PROSPERITY AMONG CREAMERYMEN AND DAIRYMEN

Every creamery in the country should be equipped with

DE LAVAL CREAM SEPARATORS

for factory use or arrange to place the

DE LAVAL FARM SEPARATORS

with all their patrons.

The wisdom of this course will be apparent at the year's end, when largely increased profits for both creamery and patrons will be in evidence, as is invariably the case where the DE LAVAL machines are used.

The De Laval Separator Co.

Randolph & Canal Sts., CHICAGO.
1213 Filbert St., PHILADELPHIA.
9 & 11 Drumm St., SAN FRANCISCO.

GENERAL OFFICES:
74 Cortlandt St., NEW YORK.

121 Youville Square, MONTREAL.
75 & 77 York Street, TORONTO.
248 McDermot Avenue WINNIPEG.

Wanted—Man with family to work dairy farm of 160 acres, on shares. 20 Jersey cows. Sell to creamery or make butter at home. Silo, separator, teams, tools; everything complete except one team. A fair chance for an experienced man with little capital. Business established twenty years. Write at once to G. H. REDFIELD, the dairyman, Edwardsburg, Mich. 49-2

For Rent—For cash or on shares, my herd of 25 cows with land for their support, including 12 acres of alfalfa; 8 room house, garden and orchard. Milk route and equipment in town of 7000; retail 45 to 50 gal. daily; cash sales for 1903, $3350. Address ANDREW BALL, Mt. Vernon, O. 49-2

For Sale—Account scarcity of both feed and water in Caledonia Co., Vermont, I will sell one car load of choice Guernsey heifers, 15 to 18 mos. old, delivered to some one point, not more than 800 miles from Vermont, at $17 per head. Who wants them? H. I. PIERCE, Columbus, Ohio.

O. Douglass has the cultures for butter and cheese making that take the prizes. They are the best yet produced. Send orders for free sample and instructions to O. DOUGLASS, 25 John St., Boston Mass. 45-sp

Feed Protegran—For economy and best results. Write the DEWEY BROS. CO., Blanchester, O. 44-tf

Partner Wanted—To purchase half interest and operate small ice plant and creamery. Good proposition to right man. Address W. P. ROBERTSON, Madison, Ga.

We will sell at public auction, to the highest bidder, the co-operative creamery, on the 8th day of February, 1904. NORTH FREEDOM CRY. CO., North Freedom, Wis. 49-2

For Sale—Combined cheese factory and store, three years old, good location in Chippewa Co. Will make now twelve hundred dollars per annum and will increase rapidly. Too many other duties to attend to it. Address "CHIPPEWA." care Hoard's Dairyman. 49-2

For Sale—At a bargain, two U. S. separators, turbine, 3000 lbs. per hour and No. 2½ 1300 lbs. A receiving vat, twin cream vat and churn capacity of each 400 gals., tempering vat and milk pump, 20 h. p. boiler and 10 h. p. engine. Eighteen months use. Address J. B. PRATT, Wellington, Ohio. R. F. D. No. 3. 49-2

Position—As butter maker and manager wanted by young Dane, single, 26 years old and eight years experience. Two years as instructor in dairy school. Now operating one of Michigan's largest factories. Address HELMER RABILD, Chesterfield, Mich.

A First-class, experienced butter maker desires a position in the West or Northwest. Up-to-date work guaranteed. Address A. TOBLER, Nora, So Dak. 49-5

$25 to $50—Buys a highly bred Jersey bull from 2 to 20 months old. St. Lamberts, Stoke Pogis or Tormentors, from the best herd in Ohio. Write now to P. CLAWSON, Okeana, Butler Co., Ohio. 49-5

Wanted—A steady man at $400 a year, and board on GORDON'S DAIRY RANCH, Meadow Creek, Montana.

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D, Independence, Ia. 50-tf

For Sale—One Low-Down Milk Wagon; one De Laval Hand Separator; one Star Milk Cooler. All as good as new. Will exchange for registered Guernsey heifers or good work horses. J. R. HUSTON, Dayton, Ohio. 46-4

Guernsey Cattle—All ages, both sexes for sale. Cir. free. CLOVER KNOLL GUERNSEY HERD, Orangeville, Pa. M. Sager, Supt. 41-tf

For Sale or Rent—Dairy farm of 200 acres, 90 improved. $1.50 per hundred for milk year around. Address J. P. SOUTHARD, Harbor Springs, Mich. 42-10

For Sale—10 cheese factories, 5 farms 40 to 160 acres, saloon, dance hall and store. FRED HADLER, 775 Ida St., Appleton, Wis. 43-tf

Buff Jersey's Third Revised Edition of the Dairyman Stock Breeder and Farmers' Hand Book; 10 chapters; The Buff Jersey Silo, how to build; Soil Crops; Dairy Cows, how to handle; Barns, how to build; Abortion, cure and preventative, and many other valuable things for progressive farmers. So popular has become the book that the author has concluded to make it an annual publication, and has put the price at a figure that makes it popular also. Postpaid, paper binding, 50c; cloth, 75c. BUFF JERSEY, Monmouth, Ill. 47-tf

For Sale—Guernsey bull, Salem's King, a fine animal 6 years old. A. PARKS, Picketts, Wis. 47-3

Wanted—One single, and one married man with two grown sons for dairy farm. State wages expected. A. J. DAUGHERITY, Streator, Ill. 47-tf

Wanted—A live man to run one of the best dairy farms in New England on shares. Three hundred and fifty acres of extra good land. Large herd of fine Jerseys go with farm. Good up-to-date buildings. Separator, churn and butter worker run by power. Farm in high state of cultivation. Large new silo. Durable running water. Farm belongs to an estate and is not for sale. For particulars address C. D. HOWARD, Shoreham, Vt. 48-2

For Sale—Choice reg. Guernsey bulls and bull calves. RAY C. BICKNELL, Ft. Atkinson, Wis. 32-tf

For Sale—A high grade Guernsey heifer 15 months old, sired by Espanore 2nd, of Mr. W. D. Hoard's herd. Price $25.00. Address E. S. CURTIS, care Hoard's Dairyman, Fort Atkinson, Wis. 48-2

For Sale—Five registered Jersey heifers. Good ones. W. T. HARBISON, Plattsburg, Mo. 48-2

Herdsman Wanted—For Clover Knoll Guernsey herd, Orangeville, Pa. 48-3

Homeseekers' Excursions to the Northwest, West and Southwest, and Colonist Low Rates West—Via the North-Western Line Excursion tickets at greatly reduced rates are on sale to the territory indicated above. Standard and Tourist Sleeping Cars. Free Reclining Chair Cars and "The Best of Everything." For dates of sale and full particulars apply to agents Chicago & North-Western R'y. 49-sp.

Comments and Queries From Robinswood Farm.

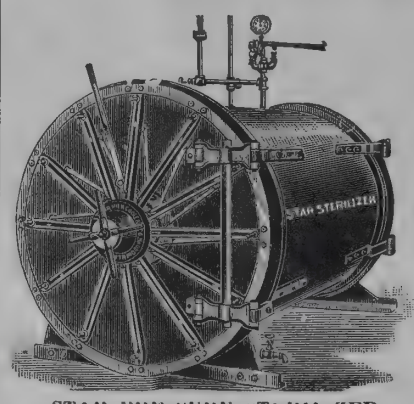
The Relationof Quality in Food to the Evolution of the Butter Cow—Determination of Desirable Type Dependent on Economical Production and Purchase of Food—Concentration and Digestibility in Food Substituting Narrowness of the Ration.

ED. HOARD'S DAIRYMAN:—There is a limitation to the productive ability of any individual cow or human being, and it doesn't do to spread one's efforts out too thin. It is a pity that most Americans do spread themselves out up to the limit of their capacity. During the past six months, building and engineering work on the farm, has absorbed all my time to the exclusion of correspondence over cow problems. In commenting on subject matter that has appeared at times during the last year, and as to which I have retained memoranda, I must "hark back" to the issue of DAIRYMAN of Oct. 9th; in the editorial on page 774, I found in the article entitled "Feed Limitations", what I believe to be several debatable propositions, and as to which I cannot wholly agree, unless they should be modified to some extent. In substance they were as follows: First, that the elements in milk are always in a certain fixed proportion to each other. Second, that the proportion each cow is found to produce, is determined at birth and is practically unchangeable. Third, that we must confine ourselves to breeding influences, which means, I presume, the fixation of accidentally induced variations in type, if we are to produce a large percentage of butter fat in milk. Fourth, that we can only induce quantity of milk through feed, and not quality. While I admit that there is considerable evidence going, to prove such conclusions, still as stated, I think they they go too far, and that they are not in harmony with various generally accepted scientific determinations. If I thought these propositions were all sound, I should at once give up all interest in the evolutionary development of the cow; for under such reasoning, cow breeding must ever remain a mere matter of chance and not worth the serious effort of any one's life. There seems to be in existence an idea that in some mysterious way certain methods in breeding absolutely create certain excellencies in the cow, which idea is contrary to well determined natural law. As a matter of fact, the mere pairing of animals never creates anything in the way of a sum total addition to the physical being of the progeny.

All that breeding does, in an evolutionary way, is to secure a rearrangement of structural and functional features; strengthening some, but in such instances always weakening others in a corresponding degree. The law of correlation pertains in this matter. The real causes of creative evolution in the cow, are the influences of environment that operate from without the animal, both on the individual and on the individual's ancestry. The breeding merely fixes and holds for a less or greater time the changes in the animal, produced by those outside influences. Every animal is continually undergoing such changes, advancing or retrograding in weight, in digestive and productive capacity, in general vigor, and changing in character and disposition. The best of blood will deteriorate if not properly cared for, rightly fed, etc. The milk of a cow is also constantly changing in its nature as to total presence of solids. It is from time to time, I believe, also changing in the relative proportion of its fat constituents to its solids not fat, though not to so great a degree as in the relative proportion of fat to the quantity of the product.

I do not think that there are sufficient data in existence to disprove my contention. There is considerable reason for thinking that my contention is a true view. The influences which govern the amount of milk produced are more numerous and more easily comprehensible, than are the influences governing the quality. We must admit that the ancestral influences which govern this matter, are by far the stronger, and largely predominate in the whole life term of the progeny, but we must also admit that the immediate influences acting on the animal have at least some power in determining the quality of the milk produced at the time, as well as in changing the various functions of the whole body.

An indisposition or inability of the stomach and intestine of the individual to digest the protein elements of feed can be largely corrected by training. The same is true of the digestive ability of the intestine, etc., to digest the carbohydrates. On the other hand, we can reduce excessive activity of function in the several parts of the digestive tract, as well as in various other parts of the body. This power is under human control. In medical practice, an overworked part we rest. An inactive part we stimulate and strengthen by working it, and by diverting force generally created in the body to the particular part.



These principles can be applied in the evolution of any cow, and in time can produce very marked functional changes. There does not seem to be any strong, theoretical reason for not believing that we can change the quality of the milk in a measurable degree during the life time of the individual, and that some of this change of function can be transmitted to progeny. That we are unintelligent and lack perception as to what practice we should adopt to secure desirable functional changes in the cow is to be deplored, but it will not do to say that such practice is not at least theoretically practicable. A cow is the outcome of the influences of her environment and that of her ancestors. As soon as the dairy world comes to some definite, sound conclusions as to what type of cow is most desirable for use in any specific branch of dairying, or for any locality, breeders will begin to study and understand the influences which will enable them, as a rule, to produce such types at will, and it will be the exception when an animal is produced that is not up to a desirable average of a reasonable ideal. I think, for one reason, that it is because such an impossible and undesirable ideal is hoped for and aimed at, that so little true progress is being made in the dairy cow evolution at present. Unreasonable expectations as to ability in any one animal, in my opinion, is the most important reason why so many dairymen in this day do not find the moneyed returns from their pursuit more satisfactory. Diverse, extreme examples of such expectations are the dual-purpose cow and the phenomenal, high-producing special-purpose animal.

At present there is no scientific agreement as to which is the most desirable type of cow in connection with productive power. That must be the first point determined if true progress is to be expected. The method of securing the type will naturally follow as a sequence to the first determination. As the most powerful of the influences acting on the cow, the breadth of the ration, its digestibility, and other qualities, most largely determined in the long run and indirectly through the influence of the character of the blood, created the relative proportion of the several constituents in milk. The nature of the blood is determined by the amount of work thrown on one or other parts of the digestive system and the consequent strengthening or weakening of such parts, the nature of the blood being consequent to such digestive development, other conditions exert their influence to a lesser degree. The nature of the nutrition to which any organ is permanently subjected, determines the nature of the function of that organ. The secretion of a milk cell, or of any secreting cell, changes in a somewhat harmonious accord with the composition of the blood.

If this is so, it follows that the nature of the cow feed that can be most economically grown and bought, must largely determine the percentage of fat that it is most desirable to aim for in the profitable butter cow, and a persistent continuation in a food supply of the determined character will in time result in the production of a type of the desired nature, due diligence being given to eliminating by selection un-

We're Here for Business

WHAT CAN WE DO FOR YOU?

STAR PRESSURE STERILIZER

Shall we fit up your dairy complete and turn it over in practical working order?

Are you in the market for bottles and caps?

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want."

DAILY MILK RECORD SHEET FOR TEN COWS

We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at the following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c

SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

HOARD'S DAIRYMAN.
FORT ATKINSON, WIS.

desirable variations from the correct type. Other things being equal, the more protein a cow can digest the more milk she will produce, but there is a limit to the amount of butter fat that can be produced in connection with a large flow of milk.

If the protoplasmic contents of the milk cells are too actively stimulated by the presence of too much protein in the blood current, the proportion of fat decreases, because the interior of the cell there, is not in the best state of quietness to allow the utmost amount of fatty deposition in the cell even if the blood current is abundantly rich in fat-forming material. The same thing occurs when the milk cells receive their most powerful stimulus from the special nerve centers, as is the case shortly after calving, or when the animal is nervously excited. A certain amount of udder activity is however needed to attract the blood to the udder. The question to solve is as to just what relative amount of activity we ought to have from each of the several organs involved in the butter fat making function.

From the quite large number of reports that have lately been made of yearly yields of Jersey herds that presumably have had good ancestral influences and good direct care, it would seem that an average of 5 per cent butter fat content in a butter cow's milk is not too large a percentage to expect. This is about one-half of one per cent more than I have thought it right to expect if the cows were rightly developed to produce the greatest total yearly yield from American adjusted dairy cows, especially if we remember that the equable climatic conditions on the Island of Jersey could hardly be expected to put as much power into cattle as would our more intense North American climate. My view is that the ideal butter cow for the North American farmer must be a considerable modification of the Island bred cow.

If too much of the bodily power of the cow be given to the digestion of protein there will then be too little available for the digestion and assimilation of the carbohydrates and fatty elements of food from which butter fat is most easily produced. In my opinion, very high percentage of butter fat depends on the habitual presence of a very rich percentage of such elements in the blood as most easily make fat. There is no theoretical limit to the percentage of fat that may be present in milk, but to secure such high percentages involve formative practices that must inevitably reduce the quantity of flow.

I judge that we must admit that phenomenally high individual capacity to produce milk rich in fat is in a measure due to prenatal, accidental variation in the fat forming organs of the animal, and probably extraordinary development of the pancreas and intestinal glands. But these accidental variations which are not the result of persistent influence acting through life, cannot be depended on to be fixed permanently in progeny, inasmuch as we do not know what influences, other than selection, we can bring to bear to permanently retain such unusual functional power. The power of selective influences however is in these cases very limited because of the interposition of the various ancestral influences which always develop a new combination with every act of generation. So, after all, we must concede that we have to base our breeding efforts on the solution of the foundation problem of how much effective milk-producing cow feed, the farmer can produce from the labor that is available on the farm, or that can be economically purchased.

We are reaching some very definite conclusions as to this matter so far as it effects our Gilmanton, N. H., region, as an outcome of our experimentation of the past several years. I do not think we can profitably grow as narrow a ration as I think it is desirable to feed to highly developed cows. But we can grow a narrower ration than is generally supposed, by the proper use of the relatively cheap mineral, fertilizing elements, phosphoric acid and potash, and through the willing aid of our friends, the root bacteria that find acceptable hosts in the legume tribe. The agricultural world has been making use of this aid to the farmer for ages, but I believe that very few indeed realize how much of an aid these minute organisms may be made by intelligent practice. I think a full realization of the matter will result in the overturning of many practices that are now considered as desirable.

We proved during the past season that a mixed crop of spring vetch and spring wheat is splendid as a dry forage crop for feeding to young dairy stock, though the vetch seed is as yet rather expensive. We are working over alfalfa yet, but I do not feel encouraged because of our hard subsoil, and its harvesting is a serious trouble in our short season that is so crowded with work in June. I am inclined to believe that if the time and money that we will have to give to alfalfa is put on the clover crop, we will find more profit, especially as the clover can be cut at a more convenient season and can be included in ordinary rotations. Since I have discovered how easily clover can be grown I do not worry so much about saving nitrogen and humus outside of the soil.

The shortness of our growing seasons and the lack of heat has been particularly proved on us the past two years; and has induced us to consider the question of some changes in our farm practice. We give up the cow pea and soy bean as being too uncertain for even roughage crops in our district. Then the seeming impossibility of our being able to grow profitably a sufficiently narrow ration has turned our attention to the desirability of giving more care to securing greater digestibility as well as concentration in the ration, and this seems to be a more encouraging line of effort.

It is obviously important in dairying when growing cow feed to spread the labor available on the farm as evenly as possible over the whole working season, and this being so, we have concluded to grow less roughage and more of concentrated foods. It has been our rule to cut the oat crop only for hay, partly in order to give the clover, sown with the oats, a better chance. But it has always been difficult to cure. Its care has prevented us from cutting some grass as soon as we ought, and the cocks always have injured the clover under them even when mowed.

This year we sowed the oats alone, and allowed them to ripen, and we like this plan best. We will sow clover and timothy grass seed alone on the same patch next spring with a heavy dressing of potash phosphoric acid, and just enough nitrogen to give the seed a start. The oats will have depleted the soil of nitrogen, and I expect to get several crops of clover hay before enough nitrogen collects in the soil to bring forward the timothy in sufficient amount to crowd out the clover. When one thinks over the matter, it does not seem to be good sense to jam a cow full of unnecessary amount of roughage that is hard to digest, and make her do work that can be done by the forces of nature in the field. This consideration is especially strong if a cow has a margin of unused udder and digestive power to utilize more digestible matter than is present in the roughages.

(Continued on page 1120).

Official Records of Holstein-Friesian Cows From Dec. 18, 1903 to Jan. 5, 1904.

In this period forty-two records have been received and one corrected. Eight full-age cows averaged, 6 years, 7 months, 29 days; days from calving 24: Milk 418.5 lbs., butter fat 14.091 lbs., equivalent butter 16 lbs., 7 oz., percentage of fat in the milk 3.39. Eight four-year-olds averaged 4 years, 4 months, 9 days, days from calving 18: Milk 404.5 lbs., butter fat 15.400 lbs., equivalent butter 17 lbs., 15.5 oz., percentage of fat in milk 3.82. Ten three-year-olds averaged 3 years, 6 months, 26 days. days from calving 21: Milk 372.4 lbs., butter fat 12.885 lbs., equivalent butter 15 lbs., 0.5 oz., percentage of fat in the milk 3.47. Seventeen two-year-olds averaged 2 years, 4 months, 3 days, days from calving 16: Milk 284.2 lbs., butter fat 10.027 lbs., equivalent butter 11 lbs., 11.2 oz., percentage of fat in the milk 3.54.

It must be borne in mind that these records are made under the careful supervision of agricultural experiment stations and that 85.7 per cent of a pound of fat found in the milk is equivalent to a pound of butter. In detail the records were as follows:

Pauline Sadie DeKol 47448—5 years. 1 month, 5 days, days from calving 14: Milk 478.7 lbs., butter fat 15.753 lbs., equivalent butter 18 lbs., 6.1 oz. Owner, Chas. D. Pierce, San Francisco, Cal.

Aaggie Barbetta 42145—7 years, 7 months, 1 day, days from calving 26: Milk 364.8 lbs., butter fat 14.712 lbs., equivalent butter 17 lbs., 2.6 oz.

Madam Wickfield 32652—11 years, 6 months, 26 days. days from calving 39: Milk 411.6 lbs., butter fat 14.582 lbs., equivalent butter 17 lbs., 0.2 oz.

Netherland Pauline DeKol 2d 46697—5 years, 3 months, 17 days, days from calving 15: Milk 457.7 lbs., butter fat 14.466 lbs., equivalent butter 16 lbs., 14 oz.

Glenice Beauty's Baby 49202—5 years, 3 months, 15 days, days from calving 31: Milk 446.2 lbs.,butter fat 14.256 lbs.,equivalent butter 16 lbs., 10.1 oz.

Pietertje Adieno DeKol 42350 — 6 years, 6 months, 18 days, days from calving 19: Milk 360.7 lbs., butter fat 13.173 lbs., equivalent butter 15 lbs., 5.9 oz.

The Beauty 50916—5 years, 9 months, 16 days, days, days from calving 24: Milk 421.4 lbs., butter fat 12.946 lbs., equivalent butter 15 lbs., 1.7 oz.

Minerva Kenwood 49643—6 years 1 month, 16 days. days from calving 21: Milk 406.7 lbs..butter fat 12.842 lbs., equivalent butter 14 lbs., 15.7 oz.

Skylark Mercedes DeKol 53614—4 years, 1 month, 18 days, days from calving 10: Milk 452.9 lbs., butter fat 18.135 lbs., equivalent butter 21 lbs., 2.5 oz. Owner, Malcolm H. Gardiner, Darien, Wis.

Canary's Mercedes Fillpale 53353—4 years, 1 month, 25 days, days from calving 7: Milk 408.4 lbs., butter fat 16.052 lbs., equivalent butter 18 lbs., 11.6 oz. Owner, Wm. Everson & Son, Lake Mills, Wis.

Brookside DeKol Pauline 48425— 4 years, 7 months, 27 days, days from calving 37: Milk 450.5 lbs., butter fat 15.997 lbs., equivalent butter 18 lbs., 10.6 oz.

Alma Marie Josephine 54846—4 years,3 months, 18 days, days from calving 12: Milk 391 lbs., butter fat 15.681 lbs., equivalent butter 18 lbs., 4.7 oz.

Katie Jewel Mercedes 53252—4 years, 2 months, 5 days, days from calving 21: Milk 420.3 lbs., butter fat 15.255 lbs., equivalent butter 17 lbs., 12.8 oz.

Glista Delta 51492—4 years, 2 months, 26 days, days from calving 6: Milk 360 lbs., butter fat 14.535 lbs.. equivalent butter 16 lbs., 15.3 oz.

Edith Prescott DeKol 2d. 52073—4 years, 5 months, 12 days. days from calving 39: Milk 413.8 lbs., butter fat 14.465 lbs., equivalent butter 16 lbs., 14 oz.

Pietertje Maid of Grouw 2d. 51194 4 years. 9 months,1 day,days from calving 11: Milk 338.9 lbs, butter fat 13.081 lbs., equivalent butter 15 lbs., 4.2 oz. Owner, Malcolm H. Gardner, Darien, Wis.

Armyn's An 5th, 50399—3 years, 11 months, 21 days, days from calving 24: Milk 460.5 lbs., butter fat 16.548 lbs., equivalent butter 19 lbs., 4.9 oz.

Leda Hengerveld DeKol 53489—3 years, 5 months, 23 days, days from calving 13: Milk 418.5 lbs., butter fat 14.999 lbs., equivalent butter 17 lbs., 8 oz. Owner, McKay Bros, Buckingham, Iowa.

Daisy A. Mercedes 5th. 53642—3 years, 11 months, 24 days, days from calving 22: Milk 388.4 lbs., butter fat 14.690 lbs., equivalent butter 17 lbs. 2.2 oz. Owner, Malcolm H. Gardner, Darien, Wis.

Pietertje Maid of Grouw 3d. 53646—3 years. 9 months. 20 days, days from calving 8: Milk 359.8 lbs., butter fat 13.696 lbs., equivalent butter 15 lbs., 15.7 oz. Owner, Malcolm H. Gardner, Darien, Wis.

Korndyke Pietertje Queen 54509—3 years, 6 months, 22 days, days from calving 7: Milk 387.5 lbs., butter fat 12.646 lbs., equivalent butter, 14 lbs., 12.1 oz. Owner, Chas. D. Pierce, San Francisco, Cal,

Jetske Roe Countess 56517—3 years, 2 months, 14 days. days from calving 13: Milk 433 lbs., butter fat 12.424 lbs., equivalent butter 14 lbs., 7.9 oz.

DeKol Manor Beets 4th 53474—3 years. 3 months, 20 days. days from calving 8: Milk 357.5 lbs., butter fat 12.346 lbs., equivalent butter, 14 lbs., 6.5 oz. Owner, Chas. D. Pierce, San Francisco, Cal.

Pontiac Peace 53434—3 years, 5 months, 15 days, days from calving 25: Milk 326 lbs., butter fat 11.200 lbs., equivalent butter 13 lbs., 1.1 oz.

Pontiac Justice 53436—3 years, 4 months, 18 days, days from calving 36: Milk 313 lbs., butter fat 10.186 lbs., equivalent bulter 11 lbs., 14.1 oz.

Princess Cornucopia DeKol 3d 52536—3 years, 6 months, 23 days, days from calving 55: Milk 279.3 lbs., butter fat 10.110 lbs., equivalent butter 11 lbs., 12.7 oz.

Skylark M. DeKol 57761—2 years, 10 months, 21 days, days from calving, 8: Milk 356.5 lbs., butter fat 13.632 lbs., equivalent butter 15 lbs., 14.5 oz. Owner, Malcolm H. Gardner, Darien, Wis.

Carlotta Royal Pietertje 3d 58898—2 years. 6 months, 8 days, days from calving 7: Milk 318 lbs., butter fat 12.576 lbs., equivalent butter, 14 lbs., 10.8 oz. Owner, Chas. D. Pierce, San Francisco, Cal.

Riverside DeKol Korndyke 59448—2 years, 5 months. 19 days, days from calving 20: Milk 322 lbs., butter fat 12.153 lbs., equivalent butter 14 lbs., 1.9 oz.

Daisy B. M. DeKol 62232—2 years, 22 days, days from calving 8: Milk 282.4 lbs., butter fat 11.945 lbs., equivalent butter 13 lbs.,15 oz. Owner, Malcolm H Gardner, Darien, Wis.

Netherland Netta DeKol 2d 54778—2 years, 10 months, 26 days, days from calving 9: Milk 300.7 lbs., butter fat 10.777 lbs., equivalent butter 12 lbs., 9.2 oz.

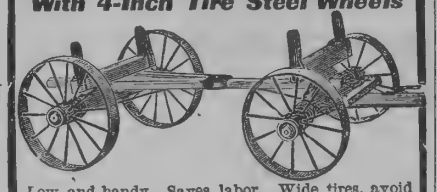
Netherland Artis Mechthilde 59609—2 years, 2 months, 22 days, days from calving 8: Milk 249.9 lbs., butter fat 10.486 lbs.. equivalent butter 12 lbs., 3.7 oz.

Skylark DeKol 62230—1 year, 11 months, 20 days, days from calving 1: Milk 276.4 lbs., butter fat 10.223 lbs., equivalent butter, 11 lbs , 14.8 oz. Owner Malcolm H. Gardner, Darien, Wis.

Betty DeKol 57448—2 years, 6 months, 15 days. days from calving 25: Milk 317.2 lbs., butter fat 10.152 lbs., equivalent butter 11 lbs., 13.5 oz.

Clothilde Ruth 56280—2 years, 8 months,8 days. days from calving 7: Milk 301.3 lbs., butter fat 10.102 lbs., equivalent butter 11 lbs., 12.6 oz. Owner Chas. D. Pierce, San Francisco, Cal.

Madge DeKol Johanna 62235—1 year,11 months, 29 days, days from calving 10: Milk 310.9 lbs., butter fat 10.084 lbs., equivalent butter 11 lbs., 12.2 oz. Owner Malcolm H. Gardner, Darien, Wis.



Olympia of Riverside 61227—1 year, 11 months, 9 days, days from calving 10: Milk 352,7 lbs., butter fat 9.514 lbs., equivalent butter 11 lbs., 1.6 oz. Owner Chas. D. Pierce, San Francisco, Cal.

Aaggie Cornucopia 2d's DeKol 2d 60718—2 years 4 months, 21 days, days from calving 11: Milk 274.7 lbs., butter fat 8.573 lbs., equivalent butter 10 lbs.

Tehee Artis DeKol Clothilde 59982—2 years, 3 months, 11 days. days from calving 32: Milk

Farmers' Handy Wagon

With 4-Inch Tire Steel Wheels

Low and handy. Saves labor. Wide tires, avoid cutting farm into ruts. Will hold up any two-horse load. We also furnish Steel Wheels to fit any axle. Any size wheel, any width of tire. Catalogue free.

CONCERNING OUR ADVERTISERS.

WATERLOO FEED COOKERS AND GRINDERS.

Any reader not yet prepared to grind or cook feed for his stock should consult the advertisement of the Waterloo Steamer & Grinder Works elsewhere in this paper. This concern is located at Waterloo, Iowa. They manufacture the Red Cross Feed Mill, sweep pattern, triple-geared, and guarantee it as to capacity, working qualities and durability, superior to any other two horse mill on the market. Their Portable Feed Steam Cooker burns wood or coal, is an easy, rapid steamer, adapted to cooking in large or small quantities, as well as tank heating, etc. It is a manufacturing concern, not a selling agent, and all their goods go directly from the factory to the user. Descriptive circulars and prices will be mailed free to anyone writing for them.

The kind of garden tool you use has about everything to do with the success of the crop, as well as the pleasure people get out of the calling. The line of Planet, Jr. tools is suited to every purpose. The users all tell the same story. One of them in Iowa, C. F. Sanderson of Linn Junction, puts it this way: "I purchased a No. 4 Drill of Hamilton Brothers. It is the best tool of the kind I ever saw. It can be used in so many different ways. You can discover a new use for it every time you use it." Don't fail to note the Planet, Jr. advertisement elsewhere.

CORTLAND, N. Y., Jan. 4, 1904.
Hoard's Dairyman, Fort Atkinson, Wis.

GENTLEMEN: I am pleased to report the growing demand for registered Holstein animals. Among the important sales from Star Farm herd not the least important is the registered bull. I note the following important sales:

To A. Starkweather of Phoenix, Arizona, the bull, A. & G. Piebe Regis DeKol No. 32514 This bull is to head one of the largest herds of registered Holsteins in Arizona.

To W. J. Manley, Esq., Salamanca, N. Y., the bull, Bernie DeKol Hengerveld, No. 32705.

To Jas. H. Wallick of Middletown, N. Y., the bull calf, Bertha of Shadeland DeKol's Boy.

To Henry T. Field of Oneida, N. Y., the elegantly bred bull, King ZoZo Paul, No. 31982.

To W. R. Selleck, the butter bred bull, America Pauline Johanna Lad.

To C. M. Crouse, Esq., the proprietor of Crouse Farms, Homer, N. Y., and a herd of nearly one hundred Holstein cattle, the bull, Daisy Pauline Paul Butter King, No. 31983.

To Jas. H. Wallick, Middletown, N. Y., the bull calf, Aaggie Dorinda's Bonnibelle Boy, a splendid specimen of the Aaggie family.

To Manson Elsbree, Waverly, N. Y., the fashionably bred service bull, Guess Not Paul DeKol 3d.

To Jas. H. Wallick, Middletown, N. Y., the service bull, Tula Butter King, sired by A. & G. Butter King and the record cow, Tula 3d.

To Mr. D. C. DeWolf of Chicago, Ill., the proprietor of DeWolf Stock Farm at Chester Hill, Mass., belongs the honor of purchasing the first bull calf out of my celebrated Mercedes Julip's Pietertje's Paul. Mercedes Julip's Pietertje's Paul 2d is from one of the best of cows. He is a handsome individual, marked very much like his famous sire and was sold for a long price to head an important herd.

Most sincerely,
HORACE L. BRONSON,
Dictated. Cortland, N. Y.

We would like to call the attention of our readers to an advertisement appearing in another column of this issue from the Farmer Seed Co., Faribault, Minn. They are practical farmers and seed growers and offer new and improved kinds of farm and garden seeds, also hardy small fruit plants. In procuring your seeds from these growers directly you will not only save money, but also get the best and most reliable seeds obtainable. They send their large illustrated catalogue to all who are interested.

A NOTABLE SEED BOOK.

It takes 144 large, closely printed pages to tell the story of Maule's seeds for 1904. It is a difficult thing to get away from the stereotyped descriptions of vegetable and flower seeds which must of necessity be offered year after year, and yet Mr. Maule has accomplished it. His Seed Book is a complete exposition of seeds and bulbs, covering the same ground as other seedsmen, but it has a freshness and variety that is very acceptable. One of the most important divisions is that devoted to novelties, the first 30 pages of the book. Farmers are warned against novelties very often, because so many of them fail to measure up to the standard set by their introducers. And the warning may be timely in some cases. But there is this to be said about the Maule novelties of former years, that almost without exception they have been found worthy of a permanent place on the farm and in the garden; and some of the best varieties of grains, vegetables and flowers to day are the Maule novelties of past years. So when we read of the new tomatoes, cucumbers, lima beans, peppers, lettuce, onions, cabbage, peas, watermelons, corn and other varieties, we are constrained by the merit of the novelties which Mr. Maule has introduced in other years, to give these new candidates respectful attention and recommend their trial. The whole book from cover to cover, is well worthy a close study. And speaking of the covers, reminds us of the beautiful group of sweet peas which grace the front cover. The picture certainly invites a close inspection of what follows. The other colored plates, of which there are seven, are a most delightful setting off of the other pages.

One of the best known dairy experts in America is Prof. T. L. Haecker, Professor of Dairy Husbandry at the Minnesota Experiment Station. Under date of January 2d he writes the Zenner Disinfectant Company, 34 Bates St., Detroit, Mich.: "I find your Zenoleum a very useful thing in the stock barn. I use it as a disinfectant, treating cows for bloat and for abortion; also use it in a general way for mange and ringworm. I find it very effective in cases of scours and cholera with calves. I have been making a specialty of calf raising for twenty-five or thirty years and would not think of being without Zenoleum."

Should Get All the Milk.

In a bulletin on the "Methods of Milking," the Experiment Station College, Ithaca, N. Y., gives a detailed report of many experiments in milking to determine the value of various methods. It advises as follows:

"There is a large financial loss in many dairies due to careless milking.

"The milk left in the udder by a careless milker is practically lost.

"All the milk secreted by a cow should be drawn at each milking.

"If necessary, manipulation of the udder and stripping should be resorted to in order to accomplish this end.

"The after-milking should be done by the regular milker and need take but little extra time.

"It is probable that such clean milking is an incentive to secretion and will increase the total yearly production of the animal."

GREEN VALE HERD Offers Sir Mercedes De Kol, No. 27097, four years old, and bull calves sired by him from choice cows, best families. Write for prices. M. F. PECK & SONS.....MARSHALL, WIS.

LOOK HERE

34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul De Kol, or Sir Ormsby De Kol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?

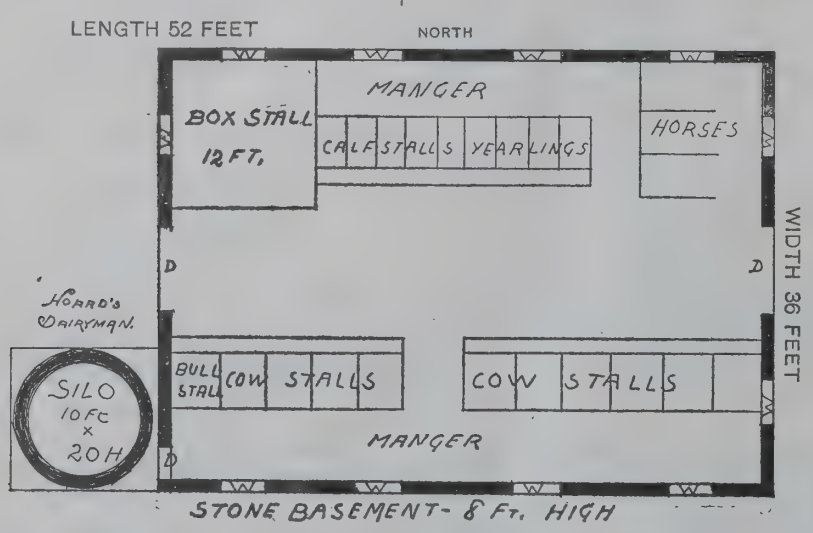
Fort Atkinson, Wis.

Comments and Queries from Robinswood Farm.

(Continued from page 1117)

We are also going to adopt a change in the method of harvesting corn. It is generally conceded that Indian corn is the cheapest cow feed that we can grow. We of course want to grow all the corn needed for silage. But we also want to grow enough to give occupation for the hands between silage cutting time and snow fall, and so grow about as large an area for dry harvesting as we do for silage. But the trouble with us is that we have so little heat in September and October that it is very hard to secure the drying of the stover. Hence we are going to give up the practice of cutting up the whole stalk and put the crop in shock. We will go back to the old time method of the father's, of cutting the stalk above the ear and allow the ear to ripen in the standing stalk. The cut tops we can put in the silo and the ears we can harvest at our convenience, after about all the valuable elements of the lower stalk and the root system as well, are transferred to the ear. As for the lower stalk and husk, they can go to the manure heap as absorbents after cutting in the machine, or even be burnt in the fields.

That burning process is not so bad a thing, if the inorganic elements of the combustion process are fed to clover or other legumes in a regular rotation. In fact with the latest day knowledge that we have, it would seem that too much insistence as to using indigestible fibre in cow feeds is not sound teaching any longer. A broad ration containing enough of concentrates will give the cow as much protein to work with as a narrower ration of roughage alone. I am inclined to believe that in the better cow the first named ration will produce as much butter and tend to an evolution of a high per cent butter fat producer; but it will also I think tend to the production of the dual type cow.



In good cow feeding we have got to give a part of the ration in concentrated, easily digested protein food, and most of these can be purchased more cheaply than we can grow them. But inasmuch as they are expensive to purchase, we must make use of them, after passing through the cow, to grow crops of some kind that can be directly or indirectly turned into money; that means that the average dairyman has got to be a general farmer to succeed best.

J. M. W. KITCHEN., M. D.

New Hamphires.

A Barn Plan with Comments.

ED. HOARD'S DAIRYMAN:— Inclosed find a plan for a cow barn for 10 cows and 2 horses and calves and young stock. If you have any better plan for a barn of that size I would be pleased to learn, as I intend to build a barn for 10 or 12 cows in the near future, and would like it as near right as I can, as long as we build new.

Now what I want is, to know if it would pay to start a sanitary milk establishment (or in other words to produce clean milk) living near a village of about 1,000 inhabitants and what breed would you prefer?

Thanking you for the many lessons learned in your valuable paper, I remain yours thankfully. E. H. G.

Ava, N. Y.

We have reproduced, as best we could from the sketch sent us, the proposed plan for stable. The scale is, one inch equals sixteen feet, but the walls show only about half as thick as they should. This makes the interior appear about two feet longer and wider than it will be in fact if the basement is built of stone. But why build the basement of stone? A frame basement or as much of it as is above ground will be warmer and more satisfactory, if not cheaper.

The points in this plan that call for reconsideration are (1) the space allowed for horse stalls, which cannot exceed 12 feet, is too little for three horses; (2) the cow stalls are too wide for small cows and too short for large cows; (3) there is no provision for feed bins; (4) the box stall is larger than necessary; (5) there is no stairway from the basement to upper floor; (6) and more important than any of these, no provision for ventilation and too few windows.

We do not undertake to say how these defects may be remedied, thinking it may be more instructive to let our readers, as well as this particular inquirer, do some planning for themselves.

It always pays to produce clean milk, but one need not adopt all the fads and furbelows that are sometimes recommended and may be more or less necessary where there is only hired help, and that not of the best, to attend to the cows.

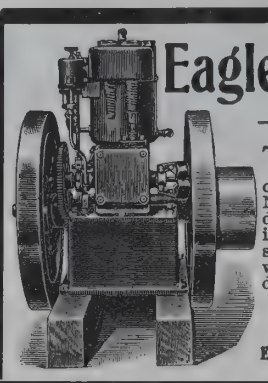
The Old Trouble.

The All-Purpose Cow.

ED. HOARD'S DAIRYMAN:—The dairy readers of the agricultural papers expect it to break out about once a year. Certain writers and talkers never appear to become immune. No one can tell the origin of the epidemic. or exactly how long it will run. It appears to go the rounds among the farmers like the mumps, the measles, or the whooping cough among children. Perhaps it is more of a foot and mouth disease, not alarmingly fatal, but expensive to indulge in. It is this notion about the "general-purpose cow," the "dual-purpose cow,"—"do-all-purpose cow" a correspondent of mine advertises them to be.

One stickler for purity of diction insists that the advocates or sponsors of this illusive race of animals shall not indulge in tautological nonsense by saying "dual purpose cow" but shall refine her name into "dual cow."

I have no issue with the makers of her name, for we have high authority for the emptiness of a name, and whether we add to or take from her name contributes nothing to her usefulness, nor to the arguments of those who exalt her.



Now, it is a significant fact that these general purpose writers who insist that the animal of their imaginative adoption is the cow for the general farmer, for those men who want to keep a few cows, make a little butter, raise a few little pigs and small potatoes, a modest harvest of wheat, not too much hay or corn or oats or clover, sell a little veal and when "life's fitful dream is over" for the poor old cow, have a carcass of cheap beef, are not in any active sense dairymen—they

The "Penny Wise and Pound Foolish"

Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED **"THE MASTER WORKMAN"**

A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Has no vibration; can be mounted on any light wagon as a portable. Weighs less than half of one-cylinder engines. Give size of engine required. Especially adapted for irrigation in connection with our centrifugal force pumps. (Sizes 2, 2½, 4, 5, 6, 8, 10, 12 and 16 horse power. Mention this paper. Send for catalogue.
THE TEMPLE PUMP CO., Meagher and 15th Sts., CHICAGO.

are generally mere instructors.

It is not supposed that this sort of skim milk talk carries any weight with the business dairymen, but it does give a kind of authoritative justification to the deluded farmer reader who is trying to put to a successful test this impracticable teaching. He has seen it written, or heard it proclaimed from some institute phonograph, that there are cows, that whole herds of them will make both beef and butter; and, resolute fellow that he is, he is going to buy up a lot of these cows and prove that it can be done.

He is not going to pay fifty or a hundred dollars for a male dairy calf when he can go to the stock yard and buy a bull old enough to use, for 2½ cents a pound, or the very pick of 'em for 3 cents.

Of course he never makes very much butter, nor very good butter—he is not strictly a dairyman, you know, and the renovating factories must get their stock of butter from some place. He does not make very much beef nor very good beef, but he has only one foot in the beef business anyhow and the beef will do to chew at and any kind of beef is better to chew than a rag.

But after he has begun to accumulate some experience, he finds that he cannot buy these cows, nor can he breed them. Some cows make nice round beef, but there is some mistake about the butter, it doesn't gather; and when he gets a good butter cow she doesn't do a thing but make butter, and for the life of him, his practice can't be made to square the other man's theory.

The average production of butter per cow per annum in the United States is about 136 pounds. There are thousands of dairies making two and three times this average, so there must be a woeful lot falling below the average, cows that are keeping their owners poor, making their owner's wives round shouldered and driving the children of the farms to the town, where they help to consume the renovated butter and the oleomargarine, and eat bologna beef.

I am not ignoring consideration of the dairy strains, that by scientific care and long lines of breeding to that end, have been built up from the legitimate beef breeds, so that there are whole families and tribes of superior dairy animals resulting.

This is not, however, an exemplification of the general purpose idea, but a demonstration of what can be done even under unfavorable circumstances by men of science, patience, skill and money.

And even these men will honestly tell us that their best dairy animals are not their best beef animals. And when they cross the beef sire on the dairy dam of their, not dual-purpose cow, but dual breed, what one of them will with any degree of certainty forecast the tribal characteristics of the offspring, eliminating of course any foreknowledge the breeder may have of the prepotent tendencies of the contracting parties?

The thing the agricultural teacher stands for at this time in relation to the teachable farmer is for his inspiration and help toward better methods and better farm equipment. It has been thought worth while to enlarge upon the doctrine of the two new blades against the old one.

This general-purpose-animal teaching, marks no advance that the ambitious student may follow. There is too much labor about even the most slovenly dairying to have to do it without pay, and for the cow keeper to read in his farm paper that the cow that will give him some milk while she milks, and leave him some cow-beef when she dies, gets little encouragement and inspiration toward the greatest possibilities of his busiuess.

Penn. W. F. McS.

The Steer and The Cow.

The Battle of Beef and Butter as Viewed by Prof. T. L. Haecker.

Prof. T. L. Haecker, of Minnesota Experiment Station, in *Dairy Record*, says:

Attention has often been called in these columns to the importance of keeping animals specially adapted to do the work expected of them. That farmers are milking cows that yield only about 150 pounds of butter annually, when it would be easy and inexpensive to gradually get a herd that will yield twice as much, does not speak well for their methods. The greatest hindrance to improvements in cows employed in the dairy is the dual-purpose fad, always preached by those who are specially interested in cattle intended for meat. These advocates are specially noted for their inconsistency. They advocate the dual-purpose idea only to those who are engaged in milk production. When it comes to beef cattle they have nothing to say about using dual-purpose sires. Then they believe in using sires specially adapted to breeding strictly beef animals. The reason assigned is, that only cattle so bred are fit for the production of beef profitably.

If this position holds good in beef production it certainly does in milk production. Dairy bred cows will produce double the profit of those not so bred. Can as much be said for the steer from the beef cow? Careful experiments have shown that steers from dairy bred cows hold their own fairly well both in the feed lot and on the block, with those from cows of the beef breeds. It is admitted that buyers of feeders, and butchers as well, are in the habit of shading the price of steers that show dairy markings; but that is only a prejudice, or used as a pretext to drive a sharp bargain.

If steers were fed and slaughtered at home for the local market, as they should be, local butchers would soon learn that there is little difference, if any, in the butchering qualities of the two kinds of steers, and dairy steers would soon sell for what they are really worth. Some, who pretend to be honest and truthful, say that dairy steers require more feed for a given gain in weight than beef-bred steers; that they mature more slowly, and are meager in the choice cuts. There is no warrant for any of these statements, and those who make them, are either blind to the facts or willfully misrepresent.

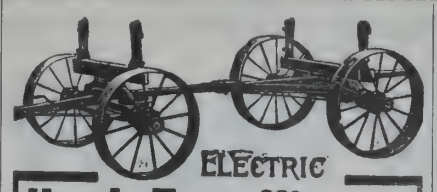
If good dairy sires were used by the farmers of Minnesota, who are milking 800,000 cows, the annual yield of butter per cow could soon be raised from 150 to 250 pounds of butter per cow, which would increase their earning capacity $20 per cow, and would add $16,000,000 to their income. Can as much or half as much be said for results if beef sires were used exclusively? As a matter of fact, under present conditions—the high price of feed and very low price of steers—there is little, if any, profit in either raising or feeding steers. And it is no wonder that those who jumped onto the dual-purpose and beef band wagons are beginning to discuss the advisability of killing the beef-bred calves. It is really becoming a question of great importance so long as the beef combine can dictate the price of steers and dressed meats.

Is There Any Profit in Stalk Fields?

ED. HOARD'S DAIRYMAN:—Your answer to our inquiry appears on page 1052, Dec. 25, '03, and am sorry to say that we forgot to state what roughage we have. This winter we have got timothy hay with a little clover in it, but not enough so you could call it half and half, and shredded corn fodder.

Since writing you we have sold enough barley to furnish us in bran and oil meal, so will have to omit the barley.

At present we are feeding 4 lbs. bran, 6 lbs. corn and cob meal, 2 lbs. oil meal a day, with all the shredded corn fodder they will eat without too much waste at morning and all the hay that they will eat up clean at night. When the weather is 20° above, we let them out in the stalks, (as we can not cut up but half our corn), a few hours a day. When the weather is colder they are kept in stable most of the time. This ration is not fed to cows that are nearly dry if they have been milked 10 months. Cows weigh about 1,000 lbs.



Our neighbors laugh at us for keeping our cows out of the stalks when it is cold, they also think we are a "little off" for keeping a Jersey bull, but let us start to figure up the income of our different herds taken for one year, then it is our turn to laugh. R. BROS.

Belle Plain, Iowa.

We are not competent to say just how much of the stable feed is used to counteract the exposure of these cows in the stalk fields even when the mercury shows a temperature 20° above zero, but we are pretty well convinced that there is no profit in grazing the stalk fields. We believe that a fair trial would demonstrate that 4 lbs. bran, 4 lbs. corn and cob meal and 2 lbs. oil meal, with roughage as stated, would be as effective when fed to cows kept out of the stalk fields as is the larger amount specified when fed under the conditions named.

FARMER SEED CO., 25 4th St., Faribault, Minn.

ANOTHER VICTORY

FOR THE

United States Separator

THE agents of the Sharples Tubular Cream Separators are publishing pretty extensively over the country what they call a test of Cream Separators, held at the Minnesota Dairymen's Convention, at Fairmont, Minn., Dec. 17, 1903. The Sharples people in their reports are quite careful not to mention that the Sharples Separator did not comply with the rules of the test, nor comply with the rules laid down in the Sharples book of directions for running the Sharples Separator.

They are quite careful also not to report that the Sharples machine did not win, and that the money was therefore lost to the Dairymen's Association. When the dairy public examine their advertisement, they will see that the Sharples, as well as all the others, were badly beaten by the United States Cream Separator.

One of the conditions of the agreement was as follows: "No machine to skim cream of a density of less than 30 per cent butter fat." The Sharples Separator skimmed cream of only 25 per cent butter fat. To have complied with the conditions it must skim one-fifth thicker, or 20 per cent thicker cream than it did skim, and therefore the Sharples was beaten on this point.

The United States Separator skimmed cream that tested 50 per cent butter fat, just twice as rich in butter fat as the Sharples. The Sharples agent, knowing that his separator could not skim thick cream at a temperature of 62° to 70°, would not and did not comply with the agreement. All Creamerymen require thick cream because it is so much less bulk and so much less weight and transportation costs correspondingly less, and Professor McKay, of the Iowa State Agricultural College, is very emphatic in saying that the Creamerymen cannot afford to accept of thin cream because not so good a quality of butter can be made from cream that has so much skimmilk in it. It is much easier, as everyone of experience knows, to s parate thin cream than it is to separate thick cream, and separators that can run thin cream cannot run thick cream under the same conditions.

The Sharples book of directions read, "turn the crank 40 to 45 turns per minute." The average of this is 42½ turns per minute. The Sharples was turned in the test at 52 turns, which is about 25 per cent faster than their average direction to the farmers who buy them. The Sharples separator bowl was run at between 19,000 and 20,000 revolutions per minute, and more than twice as fast as the United States or any other machine in the test.

The United States book of directions reads 45 to 60 revolutions of crank per minute, average of this is 52½ revolutions. In the test the United States was turned only 50 revolutions, 2½ turns less than the average; which is 5 per cent under the average. Bear in mind then that the Sharples was operated 25 per cent faster than the average and the United States run 5 per cent slower than the average.

All experienced persons know that the Sharples can not be used but a short time at that great speed of nearly 20,000 revolutions per minute without giving out, and the Sharples Company know it best of anyone, and therefore, instruct the farmers to run their separator 25 per cent slower than it was run in the contest, and the Sharples people know it gives out quickly enough at that slower speed.

RECAPITULATION

One. The rated capacity of the United States Separator used in the test is less than the rated capacity of the Sharples machine that was used, but in the test the United States machine separated 6½ per cent more milk than the Sharples machine separated.

Two. The Sharples cream was so much thinner than it was agreed that the cream should test, that it should have been ruled out of the test.

Three. The speed of the Sharples machine was so much greater than agreed upon that it should have been ruled out of the test.

Four. It will be noticed that the only machines that complied with the conditions of the test as to the density of cream were the United States and the De Laval "Alpha." The United States skimmed cream that tested 50 per cent butter fat and the skimmilk tested .125. The De Laval "Alpha" skimmed cream that tested 32.5 per cent butter fat and the skimmilk tested .175. It will be noticed that the De Laval "Alpha" could not run as thick cream as the United States or show as good test of the skimmilk. The De Laval run as thin cream as possible and not fall below the requirements of the test, knowing that if they did fall below they would be ruled out. The De Laval cream was only little over half as thick as the United States cream. The De Laval test of skimmilk was beaten by the United States 40 per cent.

The Empire Separator, the fourth and poorest separator in the contest, was unable to produce cream that tested better than 19.5 per cent butter fat which is nearly 50 per cent poorer than the requirements agreed upon, or only about one-third as thick as the cream from the United States, and the Empire skimmilk tested .450 which shows that the Empire left nearly four times as much butter fat in the skimmilk as the United States.

Five. Because of the failure of the Sharples separator to comply with the agreement in the challenge, it will be noticed that the judges made no award, but simply report what each separator did and whatever the Sharples Company now claim to have won must be claimed in the face of their failure to comply with the agreement previously entered into.

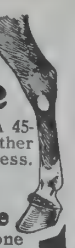
The record of the report of the judges proves beyond successful controversy, that the United States Separator proved itself to be superior in every point desirable for a practical cream separator.

Six. The Sharples Separator cannot run 200 pounds of cold milk of a temperature between 62° and 70° at the speed advocated for the farmers to use it, and show a good test of the skimmilk, and make thick cream that will test 50 per cent butter fat, and the agents of the Sharples machine know this better than anyone else. It is an impossibility for the Sharples machine to make such a run, and until the Sharples people can successfully disprove the above statement, it is not worth the while of the United States Separator to pay any attention to their continual attempts at bluffing.

VERMONT FARM MACHINE COMPANY

BELLOWS FALLS, VERMONT

Worth $100 A Bottle.



Collinsville, Texas, Feb. 10, 1903.
Dr. B. J. Kendall Co., Enosburg Falls, Vt.
Gentlemen:—I read your advertisement the other day in regard to Kendall's Spavin Cure, and having two fine and valuable horses which had been lame with Spavin for nine months, I sent to the druggist at Decatur for a bottle of Spavin Cure, which in six weeks removed all lameness and soreness, and a Splint from another one, and all three horses are sound as colts. **The one bottle was worth $100 to me.** You may use my name at any time you wish. Very truly yours,
P. H. SEGLER.

Price $1; six for $5. As a liniment for family use it has no equal. Ask your druggist for **Kendall's Spavin Cure,** also **"A Treatise on the Horse,"** the book free, or address

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Precautions after Abortion.

I want to ask what precautions should be taken with a cow that has aborted, caused, as we think, by too much ensilage and no other feed to balance up.

My neighbor has a very fine bull which I have used some, but he is now having trouble as above, only one has so far had trouble. Is it safe for me to use his bull? What book can you recommend that treats on the principles of breeding? JERSEY.
Hunt, N. Y.

ANSWER.

The precautions to be taken after abortion have been given in detail in the last issue of the DAIRYMAN under the head of Abortion. If you know the cause of your trouble, all you have to do is to remove it. There is no danger in using your neighbor's bull if you are satisfied the cause of his one cow aborting was due to the feeding of the silage.

Schmidt Treatment for Milk Fever.

Please tell me through your paper if I should use a tonic after using the Schmidt treatment. I just lost a cow after using the treatment. She was very low when I used first treatment, after eight hours did not see much change so used it again. After a few hours she seemed bright and easy, but did not get on her feet Should I have continued to use the treatment till she got on her feet, or what should I give her for a tonic. She lived two days after taken. G. L. T.
Snohomish, Wash.

ANSWER.

If the patient appears brighter after 8 or 10 hours of the first treatment, we usually do not repeat the dose, but give her more time before administering the second dose. The time to repeat is when the patient shows no signs of improvement whatever at the end of about 10 hours. We usually give stimulants, such as aromatic spirits of ammonia, ½ to 1 oz. in a pint of water every 2 or 3 hours, provided the cow is able to swallow; if not, 1 to 2 tablespoonfuls of the above, on the tongue, every hour is sufficient. Sometimes complications set in after the effects of milk fever are over.

Cramp Bark for Abortion.

I notice you recommend Cramp bark for abortion. Do I underatand that it is to be fed to the cow, if so in what proportions and for how long? I am new in the dairy business, and having a little trouble in this direction.
Evie, Mich. J. M. K.

ANSWER.

See "Cramp Bark" last issue.

Abortion.

A friend wants a remedy for cows that abort. He informs me several of our cows have lost their calves recently, calves abort 3 to 4 months. He has been feeding some flax straw. I lay it to that. J. F. C.
Cogswell, N. D.

ANSWER.

See abortion, last issue, which gives full particulars.

Habitual Abortion.

I have a cow that has had four calves. The last three she aborted, going twice 5 months, the last 7 months in July. No other abortion in my herd of 25 cows. SUBSCRIBER.
Washington, D. C.

ANSWER.

Do not breed the cow for at least three or four months to give nature a chance to repair defects in the genital organs. Give her ½ oz. of cramp bark and 1 dram of powdered golden seal in food once or twice daily from now until she has been bred, or it may be good policy to continue this treatment a month or two after breeding.

Regarding the Hired Man.

ED. HOARD'S DAIRYMAN:—I have read with considerable interest the discussion which has been going on in your paper concerning the hired man, and to my mind while there is much of truth in nearly all that has been said, there is one cause of the present scarcity of help that has not been mentioned. That is the great demand for labor of all kinds in cities and towns since business in the commercial world has been so brisk for the past few years of so-called good times.

During the hard times of the middle '90s when manufacturing was at a stand still, there were hundreds of men looking for work, and no work to be had. At that time farm help was plentiful and wages reasonable. The cities had no attraction for the laboring man, hence he was willing to work for the farmer where he was sure of a living for himself, also for his family in case he had one.

When business became brisk and mills and factories began operations on an established basis, the tide of labor set city-ward where it remains at the present time, thus causing the great dearth of help for the agriculturist. For some reasons the life of a laboring man is a pleasanter one in town, but there are also objections to be urged.

The cry has been all along that hours were shorter, duties more clearly defined, no chores to do, attractions and recreations easier of access than in the country. On the other hand the temptations to spend money are greater, and the routine of shop and factory life is much more monotonous than that of the farm. As one man expressed it, "life in a factory is a good deal like a states prison, only in one case you are allowed to go home to dinner, and in the other you are not." Talk about the monotony of the farm, it cannot compare with the monotony of a shop or factory, where the operator stands day after day before a certain machine, turning out exactly the same pieces of work from one year's end to the other.

However, that is all in the way a person looks at it, and I have no doubt there are plenty of contented and happy working men in the various shops.

The argument made by S. B. R., of Abbington, Mass., that farmers do not pay their men promptly and frequently try to beat them out of their wages is, I think, unjust toward the great majority.

In a long term of years spent entirely among agriculturists, I know of not one case of the latter kind, although I have known instances where at the end of the season the farmer gave his note bearing the current rate of interest as a guaranty of wages due.

The average hired man of to-day takes up his wage as fast as it is earned. He must have a horse and buggy and a good time as he goes along. No one objects to this unless he spends so little time in sleep that he is unable to do a day's work by reason of it. But the good time costs money and there is not much coming at the end of the season.

With men who work on farms, the same as with men in every other vocation there are two classes. One class is trustworthy, intelligent, ambitious to get ahead and willing to try to please. The other is dissatisfied, unfaithful, careless of their employer's interests, always complaining about the wrongs of the laboring man, and the oppression of the rich.

There are men who are bound to rise. From youth they show that they have the right stuff in them. One man I know began life for himself at 14, by hiring out to a farmer at $7 a month for 8 months. He tells how he sat on the plow handles while resting his team and with a flat piece of stone for a slate and another stone for a pencil figured out how much interest he would get the following year on his savings. Today he is a rich man, all owing to thrift and economy.

As a rule foreigners are more thrifty than our native Americans. Scores of instances go to prove that the Irish, the Germans, the Swedes, the Norwegians, excel us in this most excellent virtue. If asked to name a remedy for the existing condition of affairs regarding farm help, I do not know that I could do so. One thing I do think, however, and that is just as soon as there shall come a period of depression in business and manufacturing circles, there will be a reaction and the tide of labor will again turn toward the country.

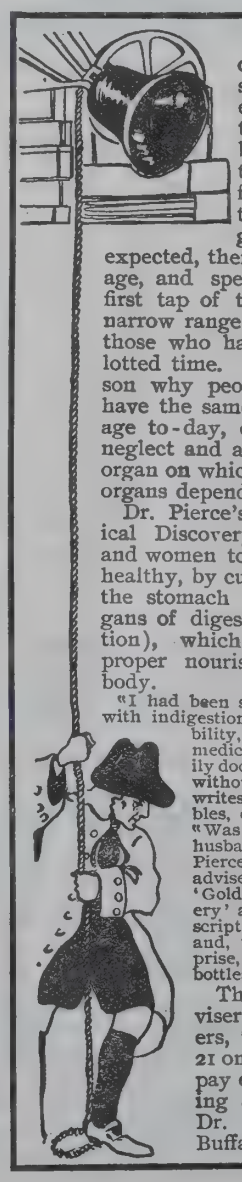
The wheels of shops and factories may be stilled for want of orders for their products, but the farm and its operations go on forever. There are fields to be tilled, harvests to be garnered, cows to be milked, chores to do, swing the pendulum of trade which way it will, and the time will come, possibly in the not distant future, when these same men who so scornfully look upon the farmer and his proffered wages will be glad to get employment at his hands. Until that time shall arrive, I look for very much the same condition of affairs as exists at the present time.

Lansing, Mich. E. E. R.

A Forty-Acre Farm.

ED. HOARD'S DAIRYMAN:—I have been a reader of the DAIRYMAN for about five years, and have seen so many good things in it that I have come to look on you as my best friend and adviser.

I have only 40 acres of land, about 14 acres in swamp land which could soon be made to afford good pasture, about 3 acres of apple and pear orchards, and the rest is plow land. Soil is mostly clay loam.



Have a round silo 10×27 feet and good machine for filling it, and stable room for about 20 head of cattle. Send milk to creamery, for which we get about 20 cents on an average, for butter fat the year round. How many cows ought the place to carry? Now, please advise me as to what crops to grow, and how to manage generally? P. J.

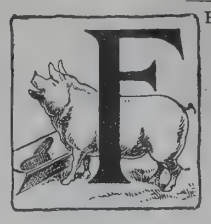
Wayland, Mich.

A silo of the dimensions given will hold about 40 tons, or enough to feed 10 cows 200 days. It should not require more than 4 acres of corn to fill such a silo. It would be a good investment to build another silo of the same size, so that one could keep more cows and also have silage for summer feeding. Eight acres of corn would fill both silos and leave quite a surplus for other purposes, but, say, give half of the plow land to corn and divide the other half between clover and small grain. In this way it would seem entirely practicable to keep at least 15 cows, 2 horses and some young stock.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

In the good old days the sexton announced a death in the community by a stroke on the church bell for every year of the life that was gone. People expected, then, to live to old age, and speculation at the first tap of the bell took a narrow range including only those who had lived the allotted time. There is no reason why people should not have the same expectancy of age to-day, except for the neglect and abuse of the one organ on which all the other organs depend—the stomach.



Dr. Pierce's Golden Medical Discovery enables men and women to be strong and healthy, by curing diseases of the stomach (and other organs of digestion and nutrition), which prevent the proper nourishment of the body.

"I had been sick for two years with indigestion and nervous debility, and had taken medicine from my family doctor for a long time without much benefit," writes Mrs. W. H. Peebles, of Lucknow, S. C. "Was induced by my husband to consult Dr. Pierce by letter. You advised me to take 'Golden Medical Discovery' and 'Favorite Prescription,' which I did, and, to my great surprise, after taking six bottles I was cured."

The Medical Adviser, in paper covers, is sent *free* for 21 one-cent stamps to pay expense of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

"ADVERTISEMENT."

SPASM OF THE GLOTTIS.

FREQUENT inquiries have been made concerning a disease in pigs characterized by spasms or fits. The attacks almost always occur in winter, when the weather is severe. Animal shows no symptoms when coming from the sleeping pen until it attempts to take food, when it will be seized suddenly, will raise its nose and gasp for breath, soon fall over and struggle for a moment or two when the seizures will abate, animal will get up and possibly appear all right.

Cause—Occasionally the first attack will prove fatal, although this is not the rule. Attacks will recur every day, or it may happen every time the animal attempts to take cold food, especially swill. The attacks come on most frequently in pigs or hogs that have warm quarters, especially those that are allowed to burrow in manure piles or straw that becomes heated. When they come into the cold air, sudden change induces attacks, especially when taking cold drink.

Treatment.—Treatment that has given the best results is to avoid the conditions that produce the difficulty. Hogs should not be housed in too warm sheds, especially if fed in a cold place. Do not give access to the manure pile, where they will burrow into the heated, half decomposed straw or become piled up and overheated.

It is also of great advantage to warm the feed, where this is practical, and anti-spasmodics should also be employed, such as from ten drops to half dram doses of fluid extract of hyoscyamus, according to size of animal; or ten to fifteen grains of bromide of potash should be given three times a day.

The rugged health that tonic doses of Dr. Hess Stock Food induces will give a hog the vital power necessary to resist these attacks. This wonderful reconstructive is the result of a lifetime of study and experiment by Dr. Hess (M. D., D. V. S.)—graduate of both medical and veterinary colleges—whose methods and works are recognized everywhere as authoritative.

Dr. Hess Stock Food is the scientific compound, sold on a written guaranty, 100 pounds, $5.00, except in Canada and on Pacific Slope; smaller quantities at a slight advance. Fed in small dose.

For every disease and condition for which Dr. Hess Stock Food is not recommended, the little yellow card in every package entitles you to a letter of advice and special prescription from Dr. Hess.

For a little information, Dr. Hess' great stock book, the only complete treatise on live stock and their diseases, will be mailed to you free, prepaid. Write Dr. Hess & Clark, Ashland, Ohio, state what stock you have, how many head of each; what stock food you have fed; also mention this paper.

AN UNEQUALED PROPOSITION

$5,000
Made by a Beaver Dam farmer in less than a month.

$1,800
Made by a Baraboo paper hanger in less than a week.

$1,200
Cleaned up by an Evansville man in one week.

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them.

A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building, This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

Annual Record of Fifty Cows in One Stable and the Lessons They Teach.

[Address by H. B. GURLER, DeKalb, Ill., before the Wisconsin Dairymon's Association.]

Mr. President and Gentlemen of the Convention: I am an Illinois man, but I never realize it when I come across the state line into Wisconsin. Our interests in the northern part of Illinois are more like your interests than they are like the interests further south in our state, and to tell you the truth I have sometimes become so tired trying to create a dairy atmosphere down there that I have actually wished that the Wisconsin state line was far enough south to take in my county. It is with great pleasure that I find myself here again with you Wisconsin people. Back some fifteen years ago I saw more of you, but there are some of the old wheel horses still alive, and it does me good to meet them. We are dropping off, one by one, but let us keep lively as long as we can.

When Prof. Henry first came here I was doing a little experimental work myself, trying to build up a dairy on the farm, and he was writing in the *Live Stock Journal* over the signature "Alimentation." I didn't know who "Alimentation" was, until we had a State Dairy convention, at Sterling, and Prof. Henry was there, and he came and introduced himself to me, and told me he was going to jump onto me on some of my figures, and we have been good friends ever since. Then, when he started the dairy school down here, at Madison, I got a letter from him, stating that they wanted me to come and instruct the boys in butter-making. I wrote him that I had not enough experience in that line, but a second and a third letter came, saying, "I have got to have you." So finally I came and this is another reason why I feel so friendly toward the Wisconsin people.

In the annual records which are summarized in the following table I have put the price of skim milk at twenty cents. Before that, I had put it at twenty-five cents per hundred, applying an old rule that skim milk is worth half as much per hundred pounds as corn is worth per bushel,—so that on these figures I have made the price pretty low, and where skim milk is used intelligently, it is worth more money than that. You will notice that the calf and the manure are not taken into consideration. It is an uncertain quantity about what the calf is worth; it depends upon what the cow is and what the sire of the calf is, and I felt it was wiser to leave the calf out entirely, and let everybody put his own value; and the same with the manure.

Then comes the cost of feed. I fed some gluten meal from the glucose factory. I fed some food from the distillery at Peoria, and got my protein cheaper in that form than in any other form, but I struck one carload that had something wrong about it; it was not palatable, and I had some sharp correspondence about it. The manager thought I didn't know what I was talking about, but he found out that I did.

That reminds me, I want to talk a moment on the question of palatability. It is the first thing to be thought of in feeding. There is any amount of nitrogen in the atmosphere, and it might as well remain there as to be in an unpalatable feed, as far as the cow is concerned. This question is not sufficiently recognized. Chemists cannot tell about the palatability of food. They know how to analyze, and that is as far as they can go, but they can't make the cow eat it and like it.

Hay was charged at $8 per ton and the corn silage at $1.50 per ton. For last year perhaps that price was a little low, but even at that I can tell you there is a good profit in growing corn for silage, if we grow fifteen tons to the acre, as everyone should. You see there is a gross income of $22.50 per acre, and if we allow $10 for interest, and the growing of it, you have $12.50 left. That will pay interest on $200 land, and not many of us are asking $200 an acre for our land. It is hard to put a market value on silage, as it is not a marketable food, but I have given the farm a profit for growing it, and I think that is sufficient.

Then I charged up for labor $12.50 per cow. That was a basis that I figured out ten or twelve years ago when I made milk for the creamery. It may not be strictly accurate. Perhaps labor is a little higher now, but if you think that is not right, you must make your own allowance, as you have got to do with a great many of these things. No man can make an arbitrary rule that will fit all of you.

That left an average profit of $19.98, after paying for the feed and $12.50 for labor. Many people do not figure the labor in. Of course they would have $32.48 for profit.

Now, out of those fifty cows I picked out nine. I picked out the four poorest cows in the stable, then I picked out a cow that would be just about on the dead line, as you might term it; she would barely squeeze through and not get me in debt. Then I picked out four of the better cows, not the best ones, but pretty good average. You see what I wanted was to get an average of the whole fifty in that nine, and to show you how near I reached that object, the average of the fifty cows was 297.7 pounds of butter, while the average of the nine that I am going to talk about was 295.3 pounds.

AVERAGE FOR FIFTY COWS, AND FOR SOME OF THE POOREST AND BEST.

There is one thing I want to drive home to you, and that is that a two-hundred-pound cow is right on the dead line. I do not live at my farm, I have to pay for all the labor. I might have a hundred such cows, and I would be none the better for having them; indeed, I would be worse off because it would annoy me until I should probably grow ugly trying to get something out of those cows and not succeeding.

We can't talk about cows without talking about capacity, and that reminds me of a story. A lady in our township has a little daughter in school who didn't get along, and the mother was worried and went to the teacher, and asked her, "What is the matter?" The teacher replied, "Your daughter hasn't any capacity." "Well," she says, "I'll have her father go right down town and buy one." Now, you can't buy capacity for cows any better than for girls, and there will be no profit in the cow that hasn't capacity.

This work was looked after by Mr. Glover, who was doing field work for

The Inside of this Building in Ten Colors

showing the clerks at work, the goods, and, in fact, an interior sectional view of every floor of the tallest commercial building in the world. It makes a very attractive and interesting wall hanger, and is one of the most complex and complicated pieces of lithography ever attempted. Money Makers For Butter Makers

Behind "Colonial" and "Liberty" Butter Salts stands the great Colonial Salt Company plant—absolutely sanitary, modern, and cleanly

Daily output 750,000 pounds.
Storage capacity 25,000 tons.
Six salt wells 3,000 feet below the surface at our plant—the purest bed of rock salt in the country—daily capacity 400 tons of salt.
Cooper shop capacity 2,000 barrels daily.
3,000 horse power boilers.
Daily supply of coal for evaporating salt, 150 tons.
Absolutely pure water from wells 150 feet deep used to dissolve the salt.
Loading tracks under cover hold 22 cars, while switch outside holds 11 additional cars.
Three trunk lines to the plant, Erie, Pennsylvania, and B. & O., facilitate immediate shipment of orders.
Every step in the process is here done by machinery, from the brine to the salt in the package, thus avoiding any chance of impurities of any kind getting into the salt. All packages are made at the works fresh every day; all cars are packed under cover; thus insuring delivery to the consumer in fresh, sweet, clean packages not soiled in any way.
Of "Colonial" and "Liberty" brands of Butter Salt

THE FLAVOR IS PERFECT
THE COLOR PERFECT WHITE

The purity the highest known, over 99 per cent. They are the lightest salts for the same bulk that there is on the market today; dissolve quickly and evenly, do not wash out in the working nor leave the butter gritty or mottled.

"Colonial" Butter Salt (light flaky grain) and "Liberty" Butter Salt (granulated, every grain the same size and perfectly square) may be tried absolutely free of cost by all who have never used them. A 56 pound sack of either or both will be delivered free on request, in return for which you are asked to report to us your actual success with them.

COLONIAL SALT COMPANY, AKRON, OHIO.

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

WORCESTER SALT--IT USES NO OTHER

WORCESTER SALT COMPANY
168 DUANE STREET, NEW YORK.

the Illinois Experiment Station. He came to my farm once in seven weeks, took a sample of the milk and tested it himself. He looked closely after what was being fed to each cow; the feed was not weighed constantly, but the milk was weighed at every milking and an accurate record kept. If there is anything that isn't just right here, it must be on the feed line, but Mr. Glover is a very intelligent, conservative man.

(Continued next week.)

Creamery Patron's Reading Matter.

ED. HOARD'S DAIRYMAN:—This is a subject of vital importance; especially is this true if the patron desires to make the best possible use of his time. The busy, thoughtful, active patron has too few hours to devote to reading. He wishes to keep informed on the condition of the markets, to know what is being put in print in his especial line of farm work that is new and which can be turned to advantage on his farm. He wishes to keep abreast of what is being done in local affiars; and also to keep in touch with some reliable information of the world's work and important events in politics, science, art, inventions and religion.

With this patron to read a half an hour means to read for a purpose. He wants something to the point. The best there is in his especial field is what he is looking for, and he will not be satisfied with second hand matter. It must come first hand from reliable sources and should come regularly.

Such a patron will have the best dairy paper in this, or any other country, and it will receive his attention, first of all the papers coming to hand at any one time. One or two local papers, and one which deals with general affairs, together with the best farm paper in his state will constitute the chief part of the reading of the active working patron. General culture and religious thoughts may be added o suit the individual taste.

But comparatively few people have formed the habit of using time well. The reading habits of most people have been developed by a haphazard reading of what came in their way, and often this has developed a taste for matter which not only is of no use whatever in the reader's occupation, but is of positive harm; first, because it has killed the time required to read it; and second, because it cannot be dropped there, but remains in the mind detracting from the efficiency of manual labor and blocking useful thought. No progress is or can be made. This kind of reading tends towards working by rote and time service. It blights ambition and brings discouraging returns in its wake.

It has been said "of the making of books there is no end" and the lists of periodicals are being lengthened with every passing month. We are crowded with both books and papers, until only a happy few can draw the line and firmly shut out what is not wanted, while keeping a moderately small list of what is best for themselves and families. We would that we could count ourselves one of this charmed circle, with no doubtful decisions as to excluded or included list.

Every patron is supposed to not only represent a family, but to be the head of that family. This may not be always literally, but should be generally, true. There is, then, to be provided reading for the whole household. Other members will be interested in the local, general and other departments of the papers already mentioned. These may be full and attractive enough to leave nothing more to be desired, or one or two papers devoted to such matters as the ladies desire and one for the young people might be added. If any members are especially interested in gardening, poultry, bee keeping or other branches of course the leading periodical for that industry would be indicated.

Recently we have asked for a voluntary contribution to this subject by the patrons of the co-operative creamery at Skowhegan, Maine. Readers will remember some articles about this creamery and its patrons early in this volume of the DAIRYMAN. These voluntary reports give the names of periodicals and the number of years they have been coming to the tables of the patrons who report.

As in the former case, about one-third of the persons addressed replied to the inquiry. Of these replies 81 per cent were from persons who had replied in the former case, and 19 per cent of these replies were from persons who were not on the list which received the previous circulars.

Ten per cent of those who replied to the questions asked, subscribe to one of two distinctively dairy papers, and all but one of these are reading HOARD'S DAIRYMAN.

Fourteen regular farm papers are going to 81 subscribers among these reporters, being approximately one-fifth more than one paper apiece. There are sixty subscribers to one or more local papers. The *Somerset Reporter* is taken more largely than all others and the average term of subscription exceeds fifteen years. A number of these subscribers take more than one local paper and quite a percentage do not take the local paper, or any one which can be counted as a dairy or farm paper.

Seven woman's papers reach eleven subscribers among these reporters, and the average time these have been on the subscription lists is above three years.

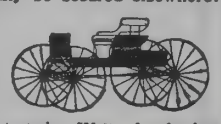
Eight religious papers have been reaching seventeen subscribers for ten or more years each on an average. In one case forty-five years.

The following periodicals appear once or twice each in the reports received:

McClure's, Munsey's, New York Independent, Outlook, Review of Reviews, Everybody's Magazine, Saturday Evening Post.

Of the papers devoting much space to fruit growing are *Rural New Yorker* and *Green's Fruit Grower*, the latter appearing six times. The *Rural New Yorker* has been included amongst farm papers.

The *New York Tribune, New York Tribune Farmer*, and *Tri-Weekly Tribune* appear several times, the former having been coming to its readers 30 to 40 years and the others for about two years each.



There are in many cases too many papers, some 2 or 3 of which could well

WRITE TO US.

Every farmer should write for our illustrated catalog, explaining all about the

DREW ELEVATED CARRIER

—how it does the work of a hired man—carries the manure from stable to barnyard—drops it just where desired—returns automatically for another load—and you stay in the barn and "**Watch it work for you**"—it is self-operating—works perfectly and passes over anything on its trips in and out of the barn. The Drew Elevated Carrier saves more each year than it costs and every farmer should have one. It also carries ensilage, grain, fodder, etc., from one point to another. It does away with the barnyard wheelbarrow.

"ADVERTISEMENT."

For Singers and Speakers.

The New Remedy for Catarrh is Very Valuable.

A Grand Rapids gentleman who represents a prominent manufacturing concern and travels through central and southern Michigan, relates the following regarding the new catarrh cure, he says:

"After suffering from catarrh of the head, throat and stomach for several years, I heard of Stuart's Catarrh Tablets quite accidently and like everything else I immediately bought a package and was decidedly surprised at the immediate relief it afforded me and still more to find a complete cure after several weeks' use.

"I have a little son who sings in a boys' choir in one of our prominent churches, and he is greatly troubled with hoarseness and throat weakness, and on my return home from a trip I gave him a few of the tablets one Sunday morning when he had complained of hoarseness. He was delighted with their effect, removing all huskiness in a few minutes and making the voice clear and strong.

"As the tablets are very pleasant to the taste, I had no difficulty in persuading him to use them regularly.

"Our family physician told us they were an antiseptic preparation of undoubted merit and that he himself had no hesitation in using and recommending Stuart's Catarrh Tablets for any form of catarrh.

"I have since met many public speakers and professional singers who used them constantly. A prominent Detroit lawyer told me that Stuart's Catarrh Tablets kept his throat in fine shape during the most trying weather, and that he had long since discarded the use of cheap lozenges and troches on the advise of his physician that they contained so much tolu, potash and opium as to render their use a danger to health."

Stuart's Catarrh Tablets are large pleasant tasting lozenges composed of catarrhal antiseptics, like Red Gum, Blood Root, etc., and sold by druggists everywhere at 50 cents for full treatment.

They act upon the blood and mucous membrane and their composition and remarkable success has won the approval of physicians, as well as thousands of sufferers from nasal catarrh, throat troubles and catarrh of the stomach.

A little book on treatment of catarrh mailed free by addressing F. A. Stuart Co., Marshall, Mich.

A Household Necessity

is a good lantern. A poor one—the smoking, flickering, faintly gleaming kind which blows out easily—is an abomination. You've seen them, perhaps you own one. The reliable kind is the

DIETZ
Cold Blast LANTERN.

They are the lanterns of bright, clear, strong, white light, the thoroughly convenient and safe lanterns. No other approaches them for satisfactory service. Local dealers everywhere carry them. We send you lantern book on request to make selection. Write us.

give place to one really good dairy or farm paper.

Some lists taken at random are as follows:

	Has been Subscriber for years.
Daily Kennedy Journal	1
HOARD'S DAIRYMAN	1+
Somerset Reporter	5
Another includes:	
Bangor Commercial	15
Green's Fruit Grower	3
Somerset Reporter	20
Youths Companion	15
Another:	
Country Gentleman	3
HOARD'S DAIRYMAN	4
Maine Farmer	5
Another good list is:	
Somerset Reporter, (local)	10
Maine Farmer (state)	9½
HOARD'S DAIRYMAN	3
Farm Journal	½
Tri-weekly Tribune	2
Youth's Companion	14
Munsey's	1
Still another list runs thus:	
Lewiston Journal (a state paper)	30
Maine Farmer " "	25
Somerset Reporter (local)	25
Evening Mail "	3
Waterville Sentinel "	3
Norridgewack Gazette (local)	5
Thrice-a week World	1

Six miscellaneous and story papers completes this list.

It is notable that those whose names were not on the lists a year ago are not subscribers to any regular dairy paper, but are taking papers having second hand farm departments, except in two or three cases. These are probably new members of the creamery association, among whom may be some of the most progressive of its future patrons.

The most popular papers among these patrons appears to be *Somerset Reporter*, *Maine Farmer*, *Bangor Commercial* and *Lewiston Journal*, all state papers except the *Reporter*, which is published here at the county seat.

After our study of the conditions existing in this section, and the high cost of cattle foods, which dairymen must submit to, it seems impossible that they can realize what can be saved to themselves by subscribing for a good dairy paper and following its instruction.

It is entirely within seasonable limits to assume that $200, spent by two hundred of these patrons for HOARD'S DAIRYMAN now, Jan. 1, 1904, could easily save them in cost of feed plus what they would be likely to gain in increased yields at the creamery fully $2,000 this winter; besides their better attention to the details of handling the milk, will tend toward a higher grade of product from the factory.

We would urge every patron to study the subject of alfalfa growing to reduce feed bills, and to prepare a half acre at least for a practical trial of this plant this year. Give the best preparation possible and watch the outcome with care. It is promising of good results, and well worth the trial by every dairymen in Somerset county. FRANK E. EMERY.

Maine.

A Michigan Herd Record.

ED. HOARD'S DAIRYMAN:—Being a subscriber to your valuable paper, and having noticed reports of several dairy herds, but none from our immediate locality, thought would send you report of the herd I have been managing, for the year 1903.

This herd is composed of four Holsteins, three Jerseys and the rest grade Holsteins, Jerseys and Short-horns, all of fairly good, dairy type.

Number of cows in herd	24	
Total No. lbs. milk	154,116	
Average No. lbs. milk per cow	6,421.50	
Average price per 100 lbs. milk	$1.246	
Net receipts for milk used and sold		$1,921.28
COST OF FEED.		
Coarse feed	$232.96	
Grain	303.28	
Pasture	301.00	
Roots	24.60	
		$861.84
Net returns above cost of feed		$1,059.44
Average receipts per cow	$80.05	
Cost of feed per cow	35.91	
Net receipts per cow	$44.14	
Cost of labor 8 hours per day at 15 cents per hour for year	$438.00	
Investment, 24 cows at $50--$1200		
Interest on same at 6%	72.00	
Loss by death, two cows	100.00	
		610.00
		$449.44
Value of manure for year		182.50
Net receipts above all expenses		$631.94
Rate of interest on $1200 investment	52⅔%	

Pontiac, Mich. F. C. K.

Made for the Man Who Wants the Best.

One Man Can Spread More Manure

with our **Great Western** Endless Apron Spreader than 15 men can spread by hand, and when spread with the Great Western it is thoroughly pulverized and spread evenly, which makes 1 load equal to 3 that are spread by hand. **Made in 8 Sizes. Capacity 30 to 70 Bushels. Spreads** all kinds of manure, compost, lime, land plaster, wood ashes, cotton seeds and hulls. **It saves** time, hard back aching work and money, and more than pays for itself the first season. **Endless Apron** is always ready to load, no cranking back after each load is spread. **Can be regulated** while in motion, to spread thick or thin from 3 to 25 loads per acre. **Front Axle** is the same length as the hind one, making wheels track. Front end of box is close to horses which gives the **lightest** possible **draft. Non-Bunchable Rake** keeps all large chunks on top of beater until they are thoroughly pulverized. Combined Hood and Endgate keeps manure away from beater while loading and acts as hood in spreading. **GUARANTEE.**—We use the very best material in this machine that money can buy and we guarantee it to handle any kind of manure, no matter what it is, and if any parts break we will furnish new parts any time within one year without charge. Send for large catalogue giving illustrations and descriptions. Tells how to apply manure to secure best results.

The Strongest Fence Made

To sell direct to the farmer the strongest fence in the world, we must not only use the best ***HIGH CARBON SPRING STEEL WIRE,*** heavily galvanized, but we must build so that the greatest textile strength of material is maintained. Sixteen years, spent in perfecting ***Coiled Spring Fence,*** each year showing an added degree of perfection, has brought us to a point where we can proclaim with a confidence born of attainment that

OUR FENCE IS THE CHEAPEST AND BEST

Cheapest because the highest skill of the craft has been utilized to reduce the cost of manufacture, and this achievement, coupled with the largest output of the largest and best equipped plant in the United States devoted to fence manufacture, enables us to name you the ***VERY LOWEST PRICE AND WE PAY THE FREIGHT.*** Buy direct. We sell to you as cheap as dealers can buy. Put the dealer's profit in your own pocket. Examination permitted at your station; your money back if not as represented. Completion of sale rests wholly upon your judgment. Write us; we have something more to say to you. After correspondence is opened, you have your judgment to defend your interests at every advance of the deal. Our Catalogue is free, and is full of fence lore.

COILED SPRING FENCE COMPANY,
Box 103 **Winchester, Indiana, U. S. A.**

The Extra Money

ADVANCE

that the dealer charges (his profit) makes the fence no better. You might as well keep that part (the profit) yourself. It is easier to buy your fence direct from the factory—it gives you a larger line to choose from. We sell at wholesale prices and pay freight to your railroad station on 40 rods or more. Our **FREE FENCE BOOK** illustrates 28 Styles, and tells how the **ADVANCE FENCE** is constructed. **The Stay Wire Can't Slip** and there are no loose ends at the top and bottom of the fence. Stock can't injure Advance Fence without tearing the wires. We use only the best quality galvanized steel wire. You take no risk at all—we sell **ADVANCE FENCE** **ON THIRTY DAYS FREE TRIAL** We will let you be the judge. If you are not perfectly satisfied after giving it a fair trial you can ship it back at our expense. We sell all our fence under these conditions. None of it comes back. Our customers are satisfied. They know our prices and quality. If you knew we could expect an order from you. Your name and address on a postal card will bring our **Book and Wholesale Prices. Write today.**

How To Test Coiled Spring Wire.

Take a piece of No. 12 wire and coil it firmly around an inch rod of iron, as shown in figures 1 or 2. Try to pull the coil out of it. You may think you have done so, but upon releasing, it will assume shape shown in figure 3. Then look along the wire as you would a gun barrel; it will appear as shown in figure 4—has the appearance of a tube. This explains the great advantage of **COILED SPRING WIRE** and how it provides for contraction and expansion.

The weave of our fence is so perfect that full strength of every wire is preserved. Every twist is an expression of strength. Good enough to last a lifetime. We make it

HORSE HIGH, BULL STRONG, PIG AND CHICKEN TIGHT,

Using only **High Carbon Heavily Galvanized Coiled Spring Steel Wire;** to get this good enough we make it ourselves. Best wire makes the best fence. We ship any style of fence we make

THE EASY WAY

PLANTING HOEING CULTIVATING.

THE "PLANET JR." No. 4 Combined Drill does gardening "the easy way." It is now absolutely indispensable to best success in gardening and truck farming. It sows accurately in rows and drops accurately in hills—four, six, eight, twelve or twenty-four inches apart. Sows or drops all kinds of garden and vegetable seeds. Undeniably the best general purpose tool obtainable at any cost for the private gardener or trucker.

THE "PLANET JR."

No. 12 Double Wheel Hoe also does the work "the easy way." With its great variety of attachments, it is suited to all hand, garden and market garden work. Cultivates either astride or between the rows. Throws the earth to or from, hills up, opens furrows, breaks up the top crust, and kills all weeds as fast as a man walks. Saves expensive hand labor. Write today for the 1904 catalog. It shows forty different machines, including Hand Seeders, Hand Cultivators, Walking Cultivators, Riding Cultivators, Sugar Beet Cultivators Harrows, etc. More than 100 illustrations, including 16 beautiful half tones showing home and foreign farm and garden scenes. Mailed free for asking.

S. L. ALLEN & CO.,
Box 1107-D, Philadelphia, Pa.

MOST HEAT=LEAST FUEL

Largest firebox. Least expense and trouble. Burns wood, cobs, straw, etc. Jacket and bottom of heavy galvanized iron (double rivited.) Two heavy cast iron plates 8 inches apart compose the double top (our patent.) This double top space connects with manhole and smoke-stack, forming dead air compartment and keeping fire below water surface which saves the heat.

We have a valuable book called "Warm the Water and Save the Feed," which we will send you FREE. It's worth $1.00.

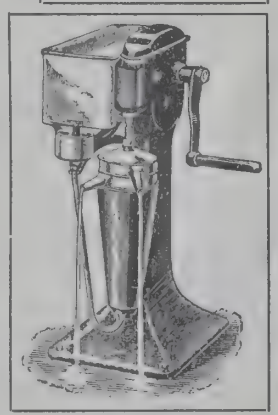
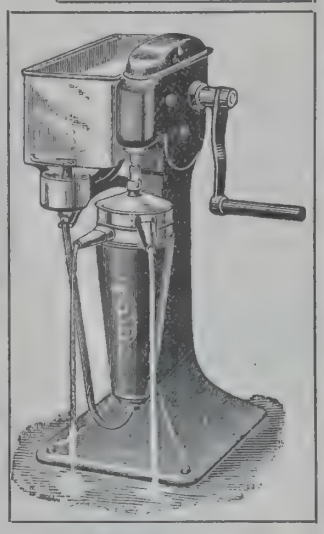
GREAT CONFIDENCE IN Tubular Separators



Most farmers are practical, honest, reliable. They like to find what they buy is as it is represented. And they like to buy up-to-date machines.

Farmers—dairymen—creamerymen—all over the world—are expressing perfect confidence and satisfaction in Tubular Cream Separators.



THEY ARE SAYING

"We like **the waist low supply can.**
"We like **the simple three piece Tubular Bowl.**
"We like **the bottom feed.**
"We like **the entirely enclosed gears.**
"We like **the self oiling gears.**
"We like the **frictionless ball bearing** from which the bowl is hung.
"We like the **Tubular Separator** because it has all of these features.

"We don't like bucket bowl separators because **not one of them has any of these features.**

Tubular Separators

Turn easier—wash easier—use less oil—wear longer—need fewer repairs than any other make. We guarantee them to cut in half any record for clean skimming any other separator can make. Below we give the results of a contest held December 17th, 1903, at Fairmont, Minn. Competitors asked us to prove our guarantee good. They named the terms and selected the milk—and THE TUBULAR DID THE REST.

An Experiment in Animal Breeding.

In 1902-3, the yearly average of the Cornell herd was 301 lbs. fat—a gain in 19 years of 28 lbs. Not great, perhaps, but a good deal, from where they started. It is not easy to break records. It has taken years to lower the race track records a few seconds. The above record is remarkable for the breed, and would be much larger in the equivalents for butter.

The selections saved, after 19 years of experiment, number 6 from the grades, and averaged in 1902-3, 321 lbs. as against 330 in 1892-3, or no gain to their credit. There are 6 left of the full-bloods that averaged in 1902-3, 314 lbs., as against 193 lbs. in 1892-3—a very decided gain. In other words, in this case the man who had chosen pedigree in preference to performance, would have gotten the greatest gain.

Were it not for the fact that every one of the calves dropped by these six full-bloods was raised, I would not think that the experiment proved much, for the grades have made about the same amount of butter. I suppose one can get much comfort out of the experiment, for either side. To me the value is greatest in the fact that by the use of good, well-bred stock, of a pure breed, which can be bought very reasonably now, one can get such a herd and such results. The Professor concluded by asking us to ponder on these suggestions: 1. What, if any, are the limitations of selective heredity? 2. The distinction between a cross-bred and a grade. 3. The use and abuse of inbreeding.

Glista and Netherland Remus produced Glista 2d. She was served by Netherland Remus, her sire, and produced Glista Netherland. Glista 2d. was served by this son four times and produced four of the six cows in the herd in 1903. Glista 4th, her sister, producing the other two: Query: "Was this inbreeding the cause of the increase?" The cows from the two sisters of same breeding are of two types. Query: "Why do they differ, and why does not their offspring from the same sire show a mingling of these two types?"

The question was asked, "Which would you choose for a sire to head your herd, the bull calf without rudimentary teats and a good pedigree, or a really fine calf with well developed teats and all the signs, without a pedigree?" Answer: "I would take the pedigreed calf." "To what extent would you let pedigree govern? was answered: "If it can be expressed in figures, 70 per cent."

I assume that when we say, "Like produces like," we mean that the combined likeness of all the ancestors (i. e.), the breed and not the particular individual before us, is meant. The extra, perfect animal may be a "sport," a variation from the average type. Sports are uncertain for breeding. There is plenty to study about yet.—C. E. C., in *Ohio Farmer.*

The Laundry Class.

In many of the schools of domestic science, laundry work is now taught in a thorough and scientific manner. In the laundry classroom Ivory Soap is always used to wash the articles that require special care and it is frequently used to the exclusion of all other soaps. It is as important to know the best materials for domestic use as to know the best methods for using them, and Ivory Soap is very generally recognized by those who have carefully investigated the subject as the safest and purest soap.

WHEAT INSPECTION EXPERIENCE

THE BEST THROUGHOUT MAKES ELMCO FEEDS SUPERIOR

Hard Spring Wheat, the strongest and best for flour or feed in America, and that means the best in the world, is used exclusively in ELMCO Feeds. But not ALL of even this wheat is used, only that which comes up to our high standard of quality.

All the wheat we use is carefully inspected by an expert Grain Inspector, member of the Minnesota Bureau of Grain Inspection, who is permanently located at our mill. The maturity of the wheat, the quantity and quality of protein and other essential points which go to make up the difference between the best grades and inferior grades of wheat, are carefully investigated.

A successful quarter of a century in the milling business is our experience record. Our trade in that time has grown from a small local patronage to one that is world wide in scope. Our mill is the largest in the country outside of the Minneapolis and Duluth combinations, the cleanest and best equipped barring none.

We are offering you superior feed at practically the same price you are paying for inferior. Ask us for samples and prices, your Banker as to our reliability.

Stable not Properly Ventilated.

Moisture and Frost on Under Surface of Roof.

ED. HOARD'S DAIRYMAN:—During the last summer I built a barn 30ft.×85 ft., with an ell on one side 20×30, putting the ell on one side 20 ft. from one end, letting the floor run clean through the main barn. This leaves 20 ft. of main barn which is used for horses and box stalls. The ell is used to store the wagons, etc. The cow stable is on the other end of barn, which leaves it 45 ft. Have arranged the cows in two rows facing outward and have put in swing stanchions, allowing three feet per cow, giving me room for 30 cows. The stable is double boarded and papered between, matched spruce being used for the outside boarding, so that I have a very tight and warm stable.

Now comes my difficulty, and I want some advice through the DAIRYMAN. I wish to say that my plan for the barn was taken from its published plans of barns, and through the description I have been able to build me a barn that is to be most satisfactory at reasonable expense, and therefore I come to the DAIRYMAN for more advice.

In finishing the barn there was no provision made for ventilating the stable, other than up through the hay chutes, and I find now in cold weather that there is moisture and frost collecting on the underside of roof, which I must prevent in some way and at the same time give proper ventilation to the stable. I have read a good deal about the King system and think I understand the method of taking the fresh air in at the top of stable and drawing it off at the bottom, but what I want to know is how many flues and how large, what they should be made of and how to properly put them in the cow stable. I should have said that the posts from the bottom of cow stable floor to plate are 20 ft. Supposing I ran the flues up the side of the barn in front of cows to the eaves and say five feet above the roof, making the flue practically twenty-five feet high, would that be sufficient? What I want is some method to prevent the frost and moisture in the upper part of barn, and at the same time properly ventilate the stable, for the best health of the cows, whether it is the King system or some other. I might also add that I have water tight gutters, six in. deep by 16 in. wide behind the cows, and the manure is run out in a manure carrier to a manure shed which is designed to keep stable as clean as possible. G. R. R.

Sheldon Junction, Vt.

The collection of moisture and frost could probably be obviated by a ventilating cupola in the ridge, but for all purposes, we should prefer constructing an independent ventilating flue outside and in the angle where the ell joins the cow stable. For 30 cows, the inside of this flue should be not less than six square feet in cross section, and more, say three feet square, would not be objectionable. It should be built on the same principle that chimneys are constructed—air tight and without any openings to interfere with draft. Like a chimney also, it should rise a little higher than the ridge of the barn.

A similar, but smaller, flue built in the angle next the horse stable would add very much to the purity of the air in that section. Have full sized openings at the bottom of these flues for keeping the stables warm in winter, and at the ceiling to let off the heated air in summer, with proper slides to close one or the other, wholly or partly, as conditions may require.

A California Cow Census.

The idea, first started by HOARD'S DAIRYMAN, of thorough census work in investigating the results of individual herds of cows, and through such investigation to show the wastefulness of ignorance, as well as the profits of intelligence, is being widely adopted.

The latest census was taken by the California State Dairy Bureau in the three counties of San Luis Obispo, Monterey and Marin. The following table is interesting, although not as full and complete as those worked out by the DAIRYMAN. Two facts are brought out by this table: (1) The low average of performance of these Californian cows; (2) the same difference in result that other cow censuses have shown, tracing back for this difference, as a cause, to the ignorance or intelligence of the owners concerning modern dairy practice:

DAIRY NUMBER.	Acres.	Cows.	Butter lbs.	Average per cow.
SAN LUIS OBISPO COUNTY.				
1	1600	80	10800	135
2	3500	395	45200	114
3	300	30	3498	116

The Dairy and Produce *Review* of San Francisco, from which we take these figures, makes the following comment:

"The reports show simply the roughest kind of guess-work. Instead of the dairymen knowing positively what their business is and what it is doing, the most conspicuous feature is the low average production by the cows in the many cases where the production is no doubt reasonably, accurately reported." * * *

All these dairies reported in the table represent those whose owners make an exclusive business of dairying, and how such people can continue in the business for many years, as most of them have, without realizing that dairying with cows with the producing capacity of those reported, is a waste of human effort, is almost impossible to understand."

The *Review* further says that there is but little if any effort made by these farmers, through breeding, to improve their cows. This is very likely true, and it is true in the east as well as in California. The difficulty is not alone "poor land, poor cows and poor methods," as the *Review* says, but it is there as every where a wide spread ignorance of what constitutes a dairy cow. Such proverty stricken results could only come from such ignorance. Do not these cow census reports show as with a search light, the great need of some means of dispelling this great cloud of ignorance?

Some of our California friends have written us saying the HOARD'S DAIRYMAN was not fitted to their latitude, because dairying on the Pacfic coast was so unlike dairying in the east. We notice however, that the poor dairyman and poor cow, east or west, are much alike in the wretched character of their outcome.

Various Silo and Silage Questions.

ED. HOARD'S DAIRYMAN:—The subject of silos has been talked quite extensively, through your columns. Yet, I have not seen anything that exactly fits my case.

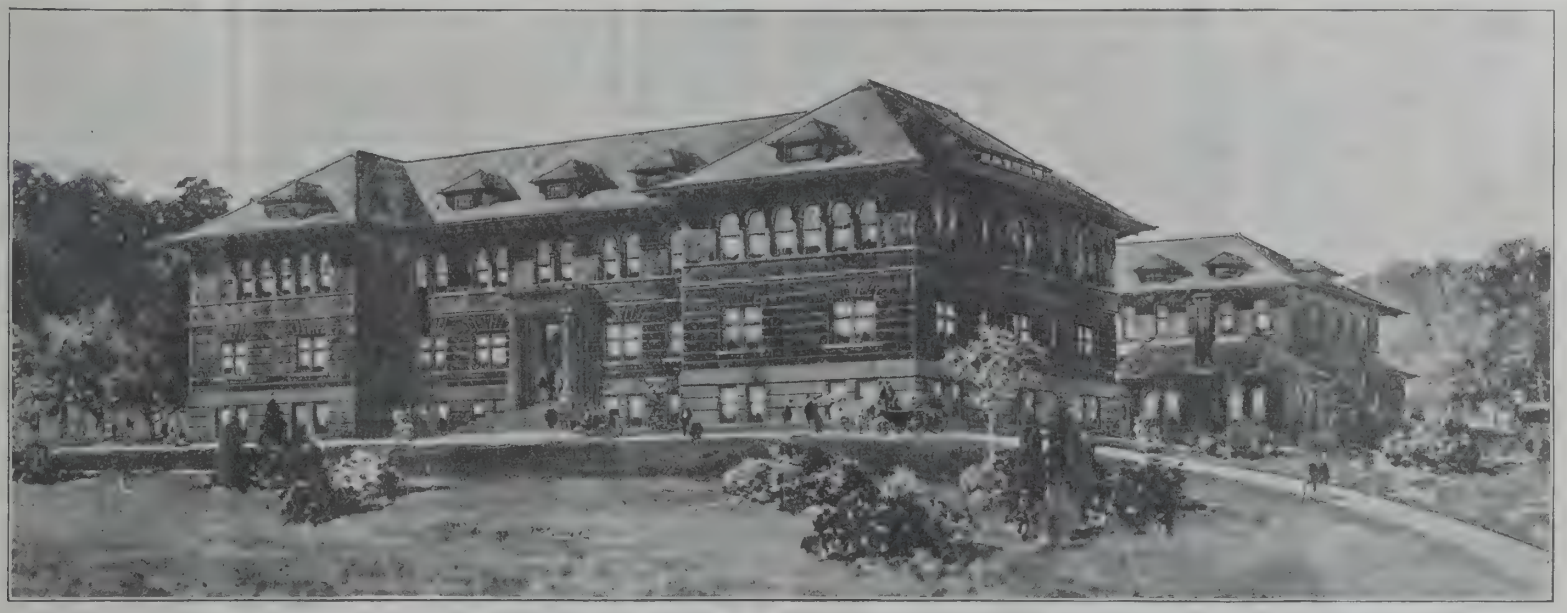
We wish silage capacity for 25 milch cows, 5 yearlings and 4 horses. We have half this amount on hand at present and in a couple of years, hope to have the limit. We think in this case we need 2 silos, a summer and one for winter, but while we have not the maximum stock now, we wish to erect one silo to use until we are needing the second one. I wish both to be about the same capacity, when erected. Will some fellow dairyman tell us how large each one of these silos should be, to furnish feed for 12 months?

(I would like for our worthy editor to suggest right here.) I shall build a round cement silo, upon the principal of Mr. H. B. Gurler of DeKalb, Ill. I have visited his dairy farm and am satisfied his plans, buildings and manner of handling milk are good enough for me. I wish my silos to be some 6 or 8 feet in the ground; provided this will do. I purpose putting a concrete wall 6 or 8 inches thick from the bottom up to the surface and build the remainder above ground on this wall. I would like to be sure it is a safe plan to go down so deep in the earth.

I wish the best variety of corn for silage. Will red clover keep if cut green and thrown into a silo without running through cutting box? I wish to put 25 or 30 tons of green clover in the silo in June and commence immediately to feed and continue so, until corn will do to make silage and then throw the corn in on top of the remaining clover. Will this plan work out O. K?

How much Portland cement will be needed per square of 10 ft. giving 1 coat, ½ inch thick and how many parts each cement and sand?

Some good brother give his experience raising corn and peas together for silage, time of planting each, if drilled or planted in hills? What variety of peas?



Lewis Co., Mo. E. A. D.

We should consider silos of 108 tons capacity ample for the purposes specified, but should prefer to have the bottom of silo not more than 5 feet below the level of the feeding floor although there is no insuperable objection to going deeper. The internal dimensions of such silos may be 16×28 ft., 17×26 ft. or 18×24 ft.

Undoubtedly clover may be stored in the silo as suggested, but our judgment is that for convenience in feeding, if for no other reason, it would be expedient to run it through the cutting box.

The best variety of corn for silage is that which will make the largest yield in the locality and reach maturity before frosts may be expected.

The "authorities" usually recommend

NEW DAIRY AND AGRICULTURAL BUILDING FOR THE STATE COLLEGE, PA.

1 part cement to 2 parts sand, but very frequently 3 parts sand are used. We seem to be unable to find any tables specifying the amounts that will be required, but any experienced mason could make a very close estimate.

We expect a full account in a short time, from a Missouri correspondent, of his methods of growing corn and cow peas for silage.

Making Rennet Extract.

ED. HOARD'S DAIRYMAN:—Do you knew of any book published that tells how to make first-class rennet. If not, please tell me how to make it.

Woods, Ore. MRS. A. E. R.

The following method of preparing rennet is taken from Decker's Cheese-making.

Prepare a sufficient number of rennets, say 500, by splitting them open so that the water can get into them. Then take a clean, oak barrel, put the rennets in and fill with water until they are covered. Salt should be added in proportion of 3 lbs. salt to 100 lbs. water. The rennets should be stirred up and pounded every day to facilitate the solution of the ferment and at the end of the week the water should be drawn off and the rennets wrung out with a clothes wringer.

They should be put into water again and again soaked for another week and the same operation gone through with. As a usual thing, the ferment has not all been extracted from the stomachs till they have been soaked for four weeks. The liquid that has been obtained by soaking the rennets should be filtered through clean straw, charcoal and sand, and an excess of salt added to preserve it. The extract should be of a clear, dark color. The first sign of decomposition of rennet extract is a muddy appearance. The above method is for a large amount, but smaller quantities can be made by following the above proportions.

At the price at which rennet extract is sold, it is doubtful if it will pay to make small amounts.

Cleaning Test Bottles.

In many creameries throughout the country we find buttermakers who do not pay any particular attention to the condition of their glassware in the factory, says C. B. Moak, of the Minnesota Dairy School.

The fact is that after the glassware has once been neglected for one reason or another, it becomes necessary to use some strong cleaning solution, and a good bit of time in again putting the apparatus in a presentable condition. In the following directions one will find a method which has been fully tried and has been found effective as a cleaner and as a time saver.

In a glass or earthernware jar make up a solution of one part bicrhomate of potassium to 25 parts of sulphuric acid, and shake and stir well, so as to dissolve the bichromate of potassium. As soon as the solution has turned slightly pinkish it is ready and may then be used, or may stand indefinitely, without injuring it, except that it will weaken unless tightly corked.

In using, only a small amount need be placed in each bottle, and in handling one should handle this with great care, as it is very apt to spatter.

After adding, shake the bottle for some time so that the sides will have been completely washed, and then allow to stand for a short while and then again shake. After the second shaking, empty the solution back into the receptacle, as this can be used over and over again for the same purpose. After the bottle has been emptied rinse with water from three to five times and then wipe dry with a cloth. After carefully using this cleaning solution upon any glassware, you will find that it looks nearly as clean as when it first came from the manufacturer.

Returns from a Small New York Herd.

ED. HOARD'S DAIRYMAN: — I have been reading the DAIRYMAN for nearly a year. I have read, with much interest, many of the reports from different dairy herds, some of them making the cows yield such a high average that one is almost inclined to stop and wonder if the reporter has accidentally made a mistake and counted only every other cow in the herd or has multiplied the income by 2. But of course we know that nothing of the sort has happened.

I have decided to give you the income from my dairy of nine cows. I began Jan 1st, 1903 with eight cows. Feb. 12th I bought a 3 year Jersey heifer which had been in milk since May '02 and came fresh again in September '03. March 1st I bought a 2 year Jersey which had been in milk since April '02 and freshened again July 31, '03. Both of these heifers were nearly dry when I got them; would not give over 2 quarts each per day. From January 1st '03 to January, 1st, '04 we sold from these nine cows 2319 14-16 pounds of butter for $494.89.

About three fifths of the butter was sold to the grocery trade, the balance to private customers. Price ranged from 17 cents to 28 cents; average a little less than 21 cents. Average per cow counting each a full year, about 258 pounds butter or $54.99. No account has been kept of milk or butter used in family of 5 and part of time 6 persons including 2 small children whose living consisted largely of milk.

Three of my cows are full blood Jersey, one grade Jersey, one grade Ayrshire, rest grade Short-horn. I use a U. S. separator. Am feeding this winter 4 pounds, ⅓ rye, ⅔ oats ground (measure); 4 lbs., ⅓ cotton seed meal, ⅔ gluten feed (weight); 1½ bu. ensilage, no corn in it to speak of and all the bright corn fodder they will clean up. My cows have grain every day in the year although the past season pasture was very abundant, the cows had a lick of grain when they came to the stable. The rye and oats were grown on the farm; cotton seed at $27 and gluten at $25. Can you compound a cheaper ration that will give as good or better results?

This does not compare well with those reports giving the cows an average of $100 or better, but is what just an ordinary picked up, farmer's herd has done, and I consider the cows have made me some money. F. H. L.

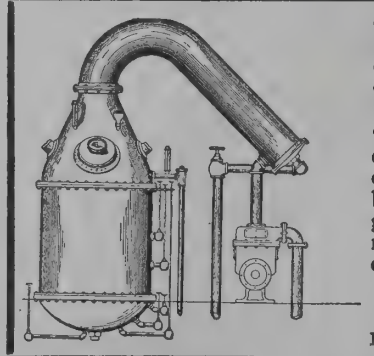
Arkport, N. Y.

The Iowa Dairy Situation.

ED. HOARD'S DAIRYMAN:—Your item on page 1038, "The Iowa Dairy Situation," is very true and if old Iowa intends to keep in the lead as a dairy state, she has got to look at the facts squarely and get out and hustle. We young men have got to do different from what our fathers did. We have got to make everything count.

Where is there a state better adapted for dairying than Iowa? And furthermore where will you find a better section in the state for dairying than this Salt Creek Valley? We have a rich soil, with deep hard pan (if you find any at all) free from stones, every foot almost of which can be turned with the plow; wells which flow the year round, pure water that does not vary 4° from 54° above zero summer or winter; railroad accommodations the best: two central creameries, one at Cedar Rapids and one at Mason City, where you can ship your cream and receive one cent less than New York highest price; and all so near Chicago that you can start your butter in the evening and it will be on the market early the next morning. With all these conditions, what better country would you want to dairy in? Iowa has got to build more silos; feed balanced rations; weed out the poor cows and raise better and buy better cows—cows that will make more at the pail: build warmer barns; read and study more; if she expects to keep up her name as the leading dairy state of the Union.

Belle Plaine, Iowa. C. H. R.



Lamp-chimneys that break are not MACBETH'S.

If you use a wrong chimney, you lose a good deal of both light and comfort, and waste a dollar or two a year a lamp on chimneys.

Do you want the Index? Write me.

MACBETH, Pittsburgh.

Milk Condensing Machine

I supply the most improved machinery and most successful processes for manufacturing all classes of condensed milk and evaporated cream. Factories built complete, put in operation and results guaranteed. If you are interested write for my new illustrated and descriptive catalogue. The only catalogue ever published on the subject.

Clean Milk *vs.* Pasteurization.

ED. HOARD'S DAIRYMAN:—In your issue of Jan. 8th, Mr. Moldenhawer has some "Convention Afterthoughts." I want to submit that a vast number of us can testify that they are not exactly "afterthoughts." He also claimed, "we would never have pure milk for the masses until we adopt some other more practical method, as proper pasteurization, etc."

First, I want to contradict his "never" and submit that the distinct gain in the quality of milk delivered in our cities from a sanitary and healthy standpoint, is sufficient evidence to warrant a flat denial.

If it was necessary, we could submit statistics of health boards in evidence and not have to go back more than five years. Again, raw, pure milk can be produced at a profit to sell at the normal price prevailing in any city.

While in Boston for the holidays, I visited two of the large contractors who run large wholesale and retail routes. One of them has an expert bacteriologist in charge, the other practices pasteurization. The milk from the former by bacteriological test, has the fewer bacteria twenty-four hours after bottling. The bacteriologist referred to told me they had one very large dairy that during a whole year they had hardly ever exceeded one thousand bacteria per c. c. He expects to reduce it to a system so as to give all retail customers such milk.

The writer was forced to retail the milk of his own dairy, and though we had to begin selling for 5 cents per quart in a village of two thousand, we knew the only way we could get trade was to give better milk. We chose to make its distinction cleanliness, and in two years we had most all the trade, and when grain advanced so we were obliged to charge 6 cents per quart, though a rival sold for 5 cents, out of 170 quarts of trade we lost only 6 quarts.

In other papers I've described under what seemingly adverse conditions we produced that milk. Here I'll only say it tested from 600-1,000 bacteria per c. c. and we couldn't steam sterilize the jars either. Here at this creamery, where we receive as high as forty thousand pounds of milk daily we have several patrons who bring milk regularly with only a few thousand bacteria.

These men tell me everybody could bring just as good milk as they do. I know it is true. Because they don't, what is the result? We have to pasteurize the cream and use pure culture starters. It makes better butter than not to do it, but we cannot get the aroma so highly prized by buyers, that good raw cream gives.

For several weeks I've been studying pasteurization from a biological standpoint and trying also to determine what is the effect upon the consumer of some of the physical changes pasteurization brings about in milk. When I find that perhaps all the germs of the infectious diseases are usually destroyed I say it is a good thing; then I find spore bearing organisms which reappear, and while I'm fairly robust, milk showing a normal growth of some of them will cause me trouble if used a few days, and sometimes only once. I feel backward about endorsing it unqualifiedly. My tests show this one thing very conclusively, that what is "proper pasteurization" for butter making, isn't "proper pasteurization" for milk consumers with whole milk.

It would be far safer for the public to advocate the adoption of such methods as the Boston dealer has in view, than to adopt pasteurization until more work has been done regarding it.

The only kind of milk the writer believes in selling is what is known as "certified milk," but he will venture to take any herd of 50 cows that have been tuberculin tested, and in most any stable, produce milk that will pass the chemical and biological tests of any of the milk commissions and not increase the cost of production over 15c per hundred above that of the usual practice.

Massena, N. Y. F. L. MARION.

Questions by a Young Farmer.

What could you say about a milk route? Is it a paying business?

How many cows could be kept on 39 acres of working land and kept good with a silo, and to raise feed enough for three horses to run the route and the farm?

About how much could be made a year on such a farm with cows, as many as can be kept on such a place, and kept good and sell milk at 5 cents a quart?

How do malt sprouts compare with bran to feed to milk cows with ensilage and clover hay, and how is it best to feed, soaked or dry, and about how much for a feed?

Which is cheapest, malt sprouts at $10 or bran at $17? Are malt sprouts any good to feed to young stock, and how are they for sows and pigs 3 or 4 months old? J. H.

Neenah, Wis.

1. So much depends upon the man in any kind of business that one cannot answer any of these questions with much satisfaction. Some men make excellent profits in distributing milk to city and village customers, while others with equal opportunities make complete failures.

2. The right kind of a man could easily keep 15 to 20 cows on 39 acres of good land. He would have to buy some feed, but with the right kind of management could more than offset this expenditure by keeping poultry and raising garden truck.

3. Good cows should yield 3,000 quarts of milk yearly, but call it 2,500 quarts. At 5 cents per quart this would amount to $125. Deduct from this the cost of delivery, depreciation of outfits, etc, and there should remain $70 to $80, net.

4. Malt sprouts contain a trifle more available nutriment than wheat bran, but as a rule cows will eat them regularly in limited amounts only, say 3 to 4 lbs. per day. They are usually soaked before feeding or mixed with silage, and some other grain should be added, bran or preferably ground corn. Just how good malt sprouts would be for young stock and sows and pigs, we have no means of knowing, but would advise this young farmer to experiment in a limited way.

Silage from Dry, Shocked Corn.

Will you be so kind as to tell one what are the probabilities of making good silage out of corn which is in shock and out in the field.

My silo would not hold all my corn and I wish to cut it now if it can be done. Some claim that it will keep all right; others that it will mold and rot. L. K B.

Otto. N. Y.

The best information we have on this subject came from Mr. J. G. Reine of Vernon county, Wisconsin, last April and was published on page 262 of the current volume.

His report states that his corn was frosted the preceding fall, the gasoline engine for running the cutter failed to arrive on time and he was forced to cut and shock the corn in the field, where it remained for six weeks. When the engine came to hand, he set up his machinery, hauled this frosted and shocked dry corn to his silo, set up a barrel on a bench beside the cutter so that with a bit of pipe and the nozzle of a sprinkling pot on the end, he could, by keeping the barrel filled with water, effectively and evenly wet the dry corn as it came from the cutter into the carrier. To use his own words, "This wet it in good shape."

The last sentence in his letter reads as follows:—"My neighbors all said I was crazy and that it would all spoil and I would have lots of manure to haul out, but, to their surprise, I have good feed."

"ADVERTISEMENT."

THE WAY OUT.

What to do When Food Don't Agree.

When food don't agree, sensible folks make a change.

Where all others fail, Grape-Nuts being predigested and all nourishment, succeeds, usually from the first trial.

A lady of Washington says: "My baby 19 months old had never seen a well day in her life. She had suffered from indigestion from the time of her birth and it seemed impossible to find any food to agree with her. She could keep almost nothing on her stomach, and her bowels were in such a constipated condition she suffered a great deal.

"It was then that I tried Grape-Nuts for her, steeping it thoroughly and straining it, putting a small portion in each feeding and it worked like a charm. She began to improve immediately and gained half a pound the first week.

"Baby got her indigestion from me, for my digestive organs have always been weak. I rely on Grape-Nuts for most of my food, for there are times when I can eat nothing else at all but Grape-Nuts. I am steadily improving and know it will entirely cure me in time, I never have "that tired feeling" any more, I eat Grape-Nuts and feel its effects in improved mental strength very forcibly." Name given by Postum Co., Battle Creek, Mich.

Annual Record of Fifty Cows in One Stable and the Lessons They Teach 1149, 1150, 1151

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

AS IT IS IN INDIANA.

C. P. Goodrich took a cow census at Plymouth, Ind., a few weeks since of 50 farmers patrons of a creamery. Note the following facts: The total number of cows was 250: the average cost of keeping per cow was $24.96; the average returns in butter fat per cow was $32.20; the average number of pounds of butter fat per cow was only 166; the average net price was 19.4 cents: the average net profit per cow above cost of feed was $7.24; the average returns for $1 worth of fead was $1.29. The six patrons who read a dairy paper averaged $21 per cow over and above the cost of feed, while the 44 who did not read a dairy paper received only $5.58 per cow above the cost of feed. Does it pay to go without sound dairy reading?

COMING EVENTS.

Ohio Dairymen's Association, Columbus, Jan. 27-29, 1904.

Massachusetts Creamery Association, Greenfield.

Wisconsin Buttermakers' Meeting, Eau Claire, Feb. 2-4, 1904.

Wisconsin Dairymen's Convention at Platteville, Feb. 10–12,1904.

WE wish to call attention of butter makers and creamerymen to the article on cream testing on page 1140. There is too little known about this subject and too much taken for granted by every one connected with creamery work, and a careful reading of the article should be made.

THE thirty-first annual report of the Wisconsin Dairymen's Association has been received. It goes without saying that this report, like the others that have preceded it, is full of good, practical things that are interesting to the farmer and dairyman.

It contains nearly 200 pages of practical dairying with but very little theory mixed in with it, enough to season it, as it were, and give it a little spice, for in spite of the popular objection to theory in farm matters, it is a good thing in leading the way to practical work.

Mr. Goodrich's report on the Fond du Lac cow census and Mr. Gurler's paper on the Annual Record of Fifty Cows in One Stable are sufficient excuse for the publication of the report if there were nothing else that was good in it—which is far from the case. It is packed with good things. The secretary has also done something that is too often neglected—provided a full index, which adds materially to its value.

WISCONSIN CHEESE MAKERS' CONVENTION.

The Wisconsin Cheese Makers' Association held its annual meeting in Milwaukee Jan. 6-8, and as usual the meeting was largely attended by a very enthusiastic lot of cheese makers.

Year by year this association is increasing in numbers and making its influence felt in Wisconsin cheese making, and its officers are to be congratulated on the constant advance the society is making.

The papers read at the meeting and the discussions that followed contained little theory, but a large amount of good cheese making practice and were confined largely to things pertinent to the cheese factory. It is evident however that beside things relating strictly to the factory, the cheese maker is being obliged, in spite of himself, to take an interest in things which he is prone to neglect, but which year by year he is finding more important. Factory sanitation is one of them; the quality of the milk that he receives is another, and in this connection the conditions of his patrons' stables and methods of handling the milk are of more than passing interest.

The program presented covered a very wide field, including the making, marketing and storing of cheese, factory sanitation, improvement of milk supply, relation of cheese maker to patron, etc.

One of the most important papers was that of Dairy Commissioner Emery, on Laws Relating to Clean and Sanitary Conditions in Cheese Factories:

"That scrupulous cleanliness in cheese factories, their floors, walls, vats, pipes, cheese makers, in milk received, and mode of manufacture is absolutely necessary to the highest quality of the product," said Mr. Emery, "is a matter of common knowledge and general assent. In theory it has been so long and generally admitted, and in practice so neglected, that the legislature of the state no doubt concluded that a law with adequate penalties for its violation might doubtless be made to contribute to the securing of so necessary and profitable a condition, and chapter 67, of the laws of 1903, was in consequence enacted."

Mr. Emery then took up the law, section by section, and explained its provisions, declaring in the course of his explanation that if the cheese factory operator allowed unclean or unsanitary milk to go into his cheese he could not shift the responsibility upon the patron, because the law placed it upon the cheese maker.

Referring to the articles of incorporation of the Cheese Makers' Association, Mr. Emery said he found that it was organized to educate its members for better work in making cheese, in the care and management of factories and the sale of the product, and the weeding out of incompetency in the business of cheese making, and he bespoke the aid of the members in behalf of the department over which he had charge. Progress had been made during the year. An assistant chemist and two inspectors had been added, and in addition to this the dairy and food commissioner had been authorized to appoint the traveling instructors now employed by the Wisconsin Dairymen's Association as his expert agents, clothing them with all the authority possessed by the commissioner himself. This more than doubled the effectiveness of the former force, but it was still too small, when taken in connection with the number of cheese factories and creameries in Wisconsin.

On this point he said:

TWELVE INSPECTORS NEEDED.

"It is possible that among Swiss cheese factories, where milk is delivered morning and evening and the factories are close together, and the number of patrons of each comparatively small, two factories a day, or ten or twelve factories a week, may be properly inspected by one man. I believe that not to exceed 250 cheese factories or creameries can be properly inspected by one man in a year. At that rate, it would require twelve men to inspect once a year the 1,800 cheese factories and the 1,200 creameries in this state. But once a year is not often enough to inspect them. Twice a year is not sufficient; yet to inspect them twice a year would require not less than 24 competent, energetic inspectors.

After speaking of the methods of inspection employed in Canada, Mr. Emery concluded:

"In high schools, graded schools, and the county training schools, and the county agricultural schools and other enterprises the state co-operates with and rewards local effort. Why not in the work of bettering our dairy conditions? I most respectfully urge a consideration of these suggestions by this association. It seems to me that greater co-operation by the agency above named, on definite lines that seem most urgent, particularly in the matter of cleanliness and sanitary conditions in our factories, would result in a higher degree of progress. But equally with laws in relation to cleanliness and good sanitary conditions there are needed high ideals and public sentiment demanding their enforcement and realization."

Prof. R. A. Moore, agronomist of the Experiment Station of the Wisconsin University, read a paper on "The Factory Operator—An Organizer for the Betterment of Rural Communities," in which he urged the members of the association to take an active part in farmers' clubs and other agricultural organizations, declaring that the defects in dairy farming could be more easily overcome through the medium of the public meeting than in any other way. He advised them to take steps to organize farmers' associations, declaring that the farmers and their families enjoyed attending such gatherings. He then went into details as to the methods to be followed in perfecting such organizations, the choice of officers, and the adoption of constitutions and by-laws.

There are many things in Canadian cheese making that could be adopted with benefit in this country and especially in connection with the government inspection and methods of instruction in cheese factories. In this connection the address of Prof. G. H. Barr, Chief Instructor of cheese making in Western Ontario, on "Instruction in Cheese Factories in Western Ontario," was especially pertinent. He said "the factories in Western Ontario had been divided into groups, the owners agreeing to pay $10 a season for instruction. The factories were visited once a month. All the instructors took a ten days' course at the Guelph Dairy school, and the chief instructor gave them pointers on their work, and inspected the different groups of factories to see that there was uniformity. The instructors visited the patrons of the factories and showed them how to avoid sending in tainted and impure milk. The instructors," he said, "did not prosecute those who sent in adulterated milk—that was left for the owners of the factories. The instructors taught in the dairy schools during the winter, and followed the students into the field during the cheesemaking season. The instructors were paid $800 a season, which amounted to about $100 a month. Their expenses were not over $150 a season, as they usually lived with the owners of the different factories they visited."

H. K. Loomis read a paper on Wisconsin cheese at the St. Louis fair, in which he set forth the importance of making a creditable display at St. Louis. "For forty years," said Mr. Loomis, "Wisconsin has been hard at work building up this great industry. Today we have in the neighborhood of $150,000,000 invested in the business. Wisconsin is second in production of cheese of any state or country in the world, and with the dairy farms being opened up it will be only a short time before we will be in the first place."

APPOINT WORLD'S FAIR COMMITTEE.

He then described the space that has been allotted to the Wisconsin cheese display at St. Louis, which is next in size to that of New York, while the space allotted to other states and countries is much smaller. At the conclusion of the paper, E. L. Aderhold of Neenah, U. S. Baer of Madison, and H. J. Noyes of Muscoda were appointed a committee to take charge of the World's fair exhibit.

E. L. Aderhold, the official critic of the association, who had been with the judges while they were making their markings and awarding the prizes, read the criticism made by the judges on the exhibits, showing the conditions that had interfered to cause them to make low scores against some of the exhibits.

Secretary U. S. Baer delivered an address on the construction of cheese factories, dwelling with particular emphasis upon the sanitary conditions that should be observed, and submitted plans which would make the factories convenient and if followed would enable them to be managed economically.

The following resolutions were passed:

WHEREAS, The dairy interests of this state are among the greatest sources of its growth and prosperity, and

WHEREAS, It is our plain duty to make the most of the natural conditions so favorable to those great interests, and that in order to hold and increase the eminence we have attained therein, our best endeavor should be made to bring about a uniform excellence in all our dairy products, therefore be it

Resolved, That we highly appreciate what the state has done to promote the best methods, by its dairy school and its instructors and inspectors; that we deem it wise and money well expended to have appointed a sufficient number of strictly competent inspectors so as to insure to each cheese factory and creamery in the state the great benefits resulting from imparting to them the best practical and theoretical knowledge of their business.

Resolved, That we are in favor of legislation insuring to the people of this state fair and just rates of freights for our products to the markets of the country.

Resolved, That the hearty congratulations of the Wisconsin Cheesemakers' Association be extended to U. S. Baer on his appointment as assistant dairy and food commissioner of Wisconsin. The selection is an eloquent tribute to the fitness of Mr. Baer, whose great services in the advancement of the dairy interests of Wisconsin are thus recognized. The Wisconsin Cheesemakers' Association is gratified that one of its ablest members should receive such an honorable position. The governor and the state dairy and food commissioner are to be congratulated on the acquisition of such an able gentleman to their executive force. Be it further

Resolved, That copies of this resolution be sent to Gov. R. M. LaFollette and Commissioner J. Q. Emery.

Resolved, That we are in favor of all laws regulating, restricting and preventing the manufacture and sale of spurious, adulterated, or unwholesome foods. That, however, we do not class butter made from whey and sold as such as being other than a natural product, and we believe that the same should in no way be classed and taxed as a "fraudulent, spurious or adulterated product."

WHEREAS, The early spring and winter work of the dairy instructors in 1903 greatly aided the cheesemakers and cheese industry in general, therefore be it

Resolved, That the Dairymen's Association be requested to send its dairy instructors to their work so early in this season as to enable them to attend the various factory meetings.

Resolved, That we tender our sincere thanks to the citizens of Milwaukee for the kind invitation, welcome and cordial reception extended to this association, and thank the proprietors of the Republican House in particular for their generous hospitality.

Resolved, That this association hereby tenders its sincere and respectful sympathy to Mrs. Cassie K. Johnston, widow of the late president, Thomas J. Johnston, of this association, whose untimely and unexpected death we all deeply deplore.

Resolved, further, That we hereby express our sorrow for the death of our former president, William C. Dixon, who, as president for four years, was a faithful, untiring worker for the good and advancement of his beloved association.

Cattle Troubles.

Sanitation and Abortion in Cattle.

ED. HOARD'S DAIRYMAN:—There is no subject connected with the keeping of cows that strikes home to the dairy farmer with deeper interest than the question: What can we do to prevent abortion?

Unfortunately there are a great many men in the business who are willing to buy medicine by the bucket full if that would do the work, but who are unwilling to put forth any effort scarcely, in the way of sanitary study of the question. To surround the cow with conditions that will prevent the growth and spread of the germ of abortion is what is meant by proper sanitation of barns. I do not believe that any medicine has been found that will cure abortion, unless certain conditions are established, and chief among these is complete isolation of the infected animal from the rest of the herd as soon as her condition is ascertained.

Not a year goes by but isolated cases appear both in summer and in winter, but five or six cows out of say 100 do not seem serious. As soon as a case appears, the animal should be at once isolated until she appears normal again, and be treated with some of the carbolic preparations, of which there are a great number on the market. The carbolic sheep dips furnish an example. The stall should be thoroughly disinfected each day, as in fact should all the surroundings. Nervous or sympathetic abortion may have more significance than we may think and there is no doubt that the first case has none of the foul smelling, decomposed appearance found in contagious abortion, May we not, therefore, infer that isolation is the first factor in the treatment?

Is it possible to prevent? Very doubtful. It would seem that dishorning, careful driving and handling, a platform long enough to prevent the hind quarters from hanging over the gutter, and so constructed as to reduce slipping to a minimum, stock raised upon the farm, fed a rational combination for growth and development, would reduce the trouble to a point where it might be compared in its effect on the total dairy loss as the chemist does with the possible "error of analysis." Then, when it does come, use the above method, to which should be added the use only of warm water for drinking for at least a week, and, better still for two weeks. Keeping the bowels open is an essential to the bovine, at all times when the system is obliged to carry off foul, poisonous matter. Sanitation inside the animal, and sanitation for the surroundings, means increased profits through better health. It will repay one to heed every opportunity to read, or listen to anything having cleanliness on its title page.

CHOKING IN CATTLE.

Choking in cattle is usually caused by swallowing a potato, apple, piece of turnip, carrot, etc. No matter what part of the gullet it is lodged in, it causes great distress. The animal coughs, saliva runs from the mouth, eyes bulge out, back is arched, and bloating also takes place. If the obstruction is in the upper part of the gullet, the animal soon dies of suffocation. If it is in the middle or lower part, the animal may live several days. If it is in the upper part of the gullet, give a little oil and then rub the hand up and down the throat to scatter the accumulation. It may be necessary to give a little oil several times, and continue the rubbing, as it may take some time to overcome the choking. In case no oil is at hand a similar attempt may be made by pouring down some water.

If the obstruction cannot be forced up or down by oiling and rubbing the gullet, use a probang, which is made of spiral wire covered with leather and which will bend with the neck. Have also a gag to put in the mouth, with a hole in the center, through which the probang passes. Oil the probang and let one man take hold of the animal's horns or ears, while another passes the probang through the hole in the gag and back into the gullet. Press gently until the object is felt, then by steady pressure it will pass into the stomach. Too much force should not be used for fear of rupturing the gullet. No unyielding article should be pressed down the gullet, as it is almost sure to rupture it.

If a probang is not convenient, take a piece of rope about ¾ to 1 inch in diameter, friz out a little of the end, and tie a piece of string around it to form a soft knot, grease this well and it will supply the place of a probang. In cases where an animal cannot be relieved by this treatment, cut down on the gullet with a knife, making an incission and removing the material. Clean the wound, and bring the edges of the gullet together firmly with silk thread or catgut, letting the ends hang out of the external wound and bring the edges of the skin together; put a bandage around and keep it wet with cold water for 24 hours, and it will usually heal. Give the animal soft food for some days, or if a probang is used and the gullet not cut, give soft food two or three days. The assistance of a veterinary surgeon should be had in this matter.

In a case of a cow being choked by an apple, the writer saw a piece of rubber hose which happened to be handy, used with good effect, the hose well greased, the cow's head held up, and the hose then shoved down her throat, pushing the apple into the stomach. It struck the writer then, that the rubber hose was the very thing for the purpose, being flexible and soft, yet stiff enough for the purpose.

DEHORNING CALVES.

Feeders and breeders know full well, that owing to the injury to which horned cattle are liable in transit, the greater amount of space they require in the feeding yards in which they are turned loose, and the irregular duration of the fattening period(due to the stronger animals driving off the weaker) hornless cattle are worth more to them than horned cattle. Under these circumstances inIreland, the system of dehorning has been strongly recommended to the farmers. The operation, if performed with caustic potash, upon young calves a few days old, is almost painless. It should not be attempted however, if the calf is more than 9 days old. The method is to clip the hair from the top of the horns when the calf is from 2 to 5 days old, slightly moisten one end of a stick of potash and rub the tip of each horn firmly for a quarof a minute, or until the potash has made a slight impression on the center of the horn. The horns should be treated in a similar manner from two to four times, according to the size of the horn and the age of the animal. About 5 minutes should elapse between each application, and if, during one of these intervals, a little blood appears in the center of the horn,it will then only be ncessary to give another very slight rubbingwith the potash. A strong piece of paper should, of course, be rolled round the end of the potash stick, which is to be held by the fingers. This system is far better than waiting until the animal is full grown before dehorning. W. R. GILBERT.

Montreal, Canada.

Old Cows and Milk Fever.

ED. HOARD'S DAIRYMAN:—In reference to F. A. M. in your last issue, I must say that his experience in regard to losing so many old cows from milk fever is a very exceptional one; in fact, I have never heard of such bad luck before. I should be greatly obliged if your correspondent would kindly let me know if the loss of these cows was spread over the 12 years or whether they were lost all within a short period. In the meantime should he have another case, let him, if within his power, inject a small quantity of pure oxygen gas into the udder, which, in most cases, will give a rapid recovery.

An explanation of this is, that the malady is supposed to be caused by anaerobic micro-organisms, which cannot live in the presence of oxygen.

Montreal, Can. W. R. GILBERT.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A Silo for Ten Cows on Twenty Acres of Land.

What I am interested in at present, is the silo. Am a renter, but have bought a place of 20 acres, good land. I have a 13-inch Ross cutter with an 18 ft.carrier, and can buy an 8x20 ft. silo (round) for either 70, 65, 59 or 54 dollars, ready to put up, rods and everything, and paint for the outside; and can get all the steam or gasoline engines I need. Would have no outlay except for the silo.

I think on this land I could keep from 7 to 8 head of Jerseys. We get 25 cents per lb. for butter the year around. This silo would hold about 22 tons. How many acres would it take to fill it—say, corn that is medium good, as I couldn't expect to have it the best until the land is in better condition ? GEO. S.S.

Millersburg, Pa.

A round silo 8 ft. in diameter and 20 ft. deep, would store only 17 tons of silage. A silo for 10 cows, should be not less than 12 ft. in diameter by 24ft. in depth. The capacity of such a silo would be approximately 42 tons, and 4 acres of good corn would suffice for filling it. From 4 to 6 feet of such a silo, may be in the ground, and exclusive of roof would require about 2700 ft. of lumber.

With intensive farming 20 acres of land may be made to support 10 cows, but in that case very little of it could be given for pasture.

An Iowa Ration.

When feeding clover and timothy hay,which is better, ground wheat and oats, or ground corn and oats, and in what proportion should they be mixed? B. A. O.

St. Ausgar, Ia.

This inquiry comes from a new subscriber and we advise him to read the DAIRYMAN carefully from week to week, and not expect to master the science or art of feeding in one or two easy lessons. One of the first things he will learn is that it may not be profitable to confine his grain feeding exclusively to the home grown grain, because it may be more profitable to sell these and purchase some bran or other by-products, such as gluten feed, linseed oil meal, brewers dried grains, etc. He should also learn that the cost or market value of the different feed stuffs should be considered, and that it makes all the difference in the world whether a cow is giving only 15 lbs. of milk or 30 lbs.

The probabilities are that his cows will eat daily about 20 lbs. of that clover and timothy hay, and such as are giving from 20 to 25 lbs. of milk should have in addition, say 4 lbs. of oats, 2 lbs. of wheat or corn, whichever is worth least in market, and 1 pound linseed oil meal. Or, if he can exchange a ton of oats for a ton and a quarter of bran, or more, as he probably can, substitute bran for oats. And then there is the matter of salt, which is altogether too much neglected. Cows should have salt every day, or better yet twice a day, a heaping teaspoonful with each feed of grain. It is to be understood that the amounts above specified are the total for twenty-four hours, and should be fed half at night and half in the morning.

Hot Iron vs. Acid Test for Cheese.

Would it be practical to use Mann's acid test to test the acidity of whey in cheese making instead of the hot iron test, or is there any other test more reliable than either of the above and what is it called, where can it be bought, etc.

Edom, Va. C. M. M.

The present tendency is to use the Mann or Farrington test to estimate the acid in curd, instead of the hot iron. The iron test is not, strictly speaking, any indicator of the amount of acid present, but indicates a certain condition of the curd caused by the action of the acid. This is at best a rough, rule-of-thumb method and will be in the near future replaced by an actual test of the amount of acid present.

Experiments carried on by Prof. Dean, the Canadian authority on cheese making, indicate that a hot iron test of ⅛ to ¼ inch corresponds to about 0.2 acid in the curd. A few practical trials with the iron and the Farrington test would soon give the correct data upon which to work. The tablets and directions can be obtained from any dealer in dairy supplies.

Drying off Cow.

Cow aborted last February and in consequence has been giving milk 18 months more or less. Is due to freshen again middle of April next, and I have concluded to dry her off as soon as possible, although she is now giving 20 lbs. per day. How is best way to proceed? D. F. H.

East Onondaga, N. Y.

Take away all grain and feed nothing but dry hay and corn stover. This will cause perceptible shrinkage in milk flow and as soon as this occurs, milk but once a day and leave some milk in udder. In a few days, increase the interval between milkings, taking only enough to relieve udder from pressure.

Sour Butter and Silage.

I put up 150 tons of ensilage last fall from sorghum and soy beans grown together in same row. On account of danger from early frost, had to cut the sorghum before it had fully matured, and the result is, I have sour ensilage. I run a herd of 40 to 50 Jersey cows and make butter and cream for private customers. Since using the ensilage, my butter is so sour that all my customers complain of it, and a good many have discontinued to take it. I at first fed 50 pounds per head,per day and the cows ate it greedily then cut down to 25 pounds per day. Am now feeding about 20 pounds, and still the butter is off in quality. I am afraid to discontinue entirely, as the milk flow has decreased as I decrease the ensilage. Now please tell me if there is any way that I can use the ensilage and keep the butter properly flavored. I have been feeding the ensilage after milking and have now cut to one feed per day. Please state at what stage sorghum should be put into silo. I cut mine with corn harvester and let most of it sun for two days.

Clarksville, Tenn. N. F. A.

Without assuming to say what may be the cause of the "sour" flavor in the butter, we are persuaded it is not due to the eating of this silage by the cows. It is possible, but not probable, that the milk or cream may take up more or less silage odor during or after milking,or the cream may be permitted to become overripe before churning. Try churning before the cream becomes too sour and wash the butter more thoroughly.

Dairy Short-horns Wanted.

HOARD'S DAIRYMAN and Dairy Review of San Francisco are the two best papers I know of for any man that is interested in a farm or stock raising, I learned more since I take these two papers than I did ten years before. Please advise me by return mail who keeps the best dairy Short-horn cattle in that part of the country.

Pescadero, Cal. M. I.

We should be most glad to give the information sought as a return compliment to this friend for his kind words and good deeds in our behalf, but most unfortunately we are unable to do so. While it is true that there are a goodly number of good dairy cows carrying more or less Short-horn blood, there are very few, if any, herds of Short-horns that are not deeply bred according to beef standards. Possibly the developments at the Louisiana Purchase Exposition in St. Louis next summer, where the Short-horns are to be put on trial to determine their dairy capacity, may lead to a discovery of animals of this breed worthy the attention of the dairy farmer.

Brown Swiss Cattle.

Where can Swiss cattle be had,that is,to be relied on their quality and butter strain. We have lately built a new creamery here in the Red River Valley county, but I see prices vary so much on butter that I should like to know where a reliable commission man could be had on the Pacific coast that could handle our product. O. J. H.

Hendrum Norman Co., Minn.

Brown Swiss cattle can be obtained from F. H. Inman, Hanover, Rock Co., Wis. Not having any personal knowledge regarding Pacific Coast commission firms, we do not wish to make any recommendation.

Oil Meal or Ground Flax Seed.

We are feeding 1 lb. to 2 lbs. oil cake meal to our cows in a mixture of ⅓ each corn cob meal, ground oats and bran by weight, with good corn ensilage and shredded corn fodder for roughage. Would there be any objection to feeding, say 10% of ground flax seed instead of the cake meal?

Muncy, Pa. M. E. R.

The objection to feeding ground flax seed is its excessive amount of oil—29 per cent. It contains more than four times as much oil as the oil cake, and if fed in any considerable amount would not only act as a laxative, but be very apt to impart an unpleasant flavor to the milk and butter.

A California Condition, Grain not Recommended.

Our ranch keeps 130 cows, fresh in latter part of March and milk eight months during year. The cows run on green meadow all year round I feed clover and rye grass hay only 6 weeks in early spring; after that the cows depend entirely upon pasture the remainder of the season. The cows are part Short-horn from pure bred Jersey sires. They only average 180 pounds butter per year.

Do you think it would pay to feed mill stuff? I would be obliged to haul it ten miles and pay for bran, $26 per ton; middlings, $33.50; oil cake meal, $34 and cocoanut cake, $27.

Rutabagas and carrots can be raised very cheaply here, and also clover and rye grass hay. Freight on butter to San Francisco market is 2 cents per pound, where we get 2nd creamery quotation. I would be pleased to have your advice on the subject and a formula of feed rations if advisable, H. E.

Crescent City, Cal.

Quite a number of prosperous dairymen have abandoned the former practice of feeding grain when pastures are in prime condition and substituted dry hay in its place, and think they receive equally good returns. When pastures become scant they resume feeding more or less grain. If these California pastures habitually get short as the season advances, it would be an excellent plan to provide clover silage to make up the deficiency and at all times feed as much hay as each cow will eat. The instinct of the cow leads her to crave some dry feed when on pasture, and it is a good policy to conform to her appetite in this respect.

A Michigan Ration—Crude and Digestible Protein—Soy Beans.

I would like your opinion on a ration I am feeding my cows. I mix one part rye, one part corn and two parts soy beans, early yellow variety ground together. I feed 4 pounds bran, 4 pounds of this mixed feed and 2 pounds rather coarse buckwheat middlings, to cows weighing 800 to 1,000 pounds and giving 25 to 30 pounds 5% milk. Roughage, clover and timothy hay night and morning and corn stover at noon; cows nearly fresh. How is that for a balanced ration?

What is the difference between crude and didestible protein? I sent a sample of my soy beans to our Experiment Station and had them analyzed and they reported them as having 41.52 per cent crude protein, 17.72 ether extract, 24.45 carbohydrates. Why would it not be a good plan for dairymen to raise soy beans to take the place of cotton seed meal and other expensive concentrates for their cows? S. H. M.

Decatur, Mich.

Assuming that these cows consume 15 lbs. of hay and only 5 lbs. of corn stover, we estimate that the ration above described contains 24.61 lbs. of dry matter in which there are 2.41 lbs. of digestible protein, 11.56 lbs. digestible carbodydrates and .84 lbs. digestible fat (ether extract.) Reference to the table on page 1014, will show that the standard there given for 30 lbs. of 5 per cent milk is 2.31 lbs. digestible protein, 14.41 lbs. carbohydrates and 65 lbs. fat. This shows that the actual ration fed is a very close approximation to the theoretical standard, except in the item of carbohydrates, and the apparent discrepancy in that item is made up probably in eating more hay and stover than we estimated. For cows giving less than 30 lbs. of milk, it would seem practicable to reduce the allowance of grain somewhat.

The difference between crude protein and digestible protein is that in making his analysis the chemist reports the total amount of protein found, but of this only 80 to 90 per cent is digestible.

The analysis of soy beans as reported by our correspondent is unusually high in protein, nearly 8 points above the average, but lower in carbohydrates, due possibly to the sample being a little better than the lot would average. The question as to whether it would be profitable to raise soy beans cannot be answered without more definite information as to the average cost of raising them. What did they cost?

Babcock Test Questions.

How warm should milk be at time of testing? How fast and how long should the tester be turned?

If milk shows a test of 4 per cent butter fat how much butter would that be to a hundred pounds of milk?

Can cream be tested; if so, how? H. F. W.

The milk should be about 70° F. when it is measured for testing.

The speed depends on the size of your tester; usually it is marked on the machine or given in the directions for using that should always go with each machine. A ten inch wheel should make 1,074 revolutions a minute; 12 inch wheel, 980; 14 inch, 909, and larger ones in proportion.

Detailed articles on testing cream will be found on pages 455 and 465 of the current volume of the DAIRYMAN.

One hundred pounds of 4 per cent milk should make a little over 4.5 pounds of butter.

Amount and Value of Silage—Cubic Feet of Straw per Ton.

I would like to know how you would figure out the amount of ensilage in a silo 14x17x29 feet high filled with a blizzard ensilage cutter. Also its comparative value with hay. Also how many cubic ft. of straw required for one ton.

SUBSCRIBER.

If the above silo was filled to the top it would contain 138 tons of silage. Its value as compared with hay depends on the price of timothy. It is estimated that one ton of good timothy is equal to 2½ tons of silage and the money value of silage would be in the same proportion.

The number of cubic feet in a ton of straw would depend on how the straw is packed; it being less in a large stack or mow than a small one. The approximate number of tons of straw in a stack can be obtained by the following method:

To find the number of cubic feet in a stack of hay multiply the width in feet by the perpendicular height from the ground to the eave or shoulder, plus one-half the perpendicular distance from this point to the crest, and this product by the length in feet.

If the stack is a low one and is fairly uniformly rounded from the ground on one side over to the ground on the other, take the distance from the ground on one side over to the ground on the other side, multiply by one-fourth the width at base, and this product by the length of the stack. As an example the average of the four measurements over the stack from ground to ground is 34½ feet; multiplying by one-fourth of 18, which is given as the width, and this product by length (237 feet) gives 36,527 cubic feet. Now, as to the number of cubic feet in a ton of hay, there are a great many things that must be considered and upon the correctness of the judgment as to the admixture of these controlling factors will depend the accuracy of the estimate.

Some of the factors affecting the weight of a cubic foot of hay are height of stack, length of time the stack has been standing, condition of hay, as regards moisture at time of stacking, coarseness of the hay and its freedom from coarse-stemmed weeds. Timothy hay will, as a rule, weigh more per cubic foot than clover, and fine timothy will weigh much more than coarse.

Where the hay is fine and the stack is 12 feet or more in height and has been standing at least six months, 425 cubic feet will usually make a ton. If the hay is a little coarse or the stack is less than 10 feet in height, it will usually require about 450 cubic feet to make a ton. In the above case, where the stack is pure clover and less than 10 feet high, unless it is very fine and has been stacked quite green, I should say it would require at least 475 cubic feet to make a ton.

Stave Silo for Georgia.

I am going to build a silo this summer to hold 75 tons, and I want to build it above ground. Would like to use 2×4 yellow pine, all heart, and fasten with iron hoops made so that they may be tightened or loosened. Would it be necessary to use building paper on the inside, or would it be better to use the paper and then 1×3 flooring, matched. Please tell me how much lumber it will require and what dimensions it will have to be to hold the above amount of silage. J. B. G.

Birmingham, Ala.

A silo 16 feet in diameter and 22 feet in depth would hold 75 tons of silage and if built of 2×4's would require approximately 2,300 feet of lumber in its construction, exclusive of roof. It is becoming not uncommon now in the north to use very temporary arrangements for roofs, just something to keep out the snow. Properly constructed stave silos are not lined. The staves shrink more or less when the silo is empty, but very soon after filling the juices of the silage cause them to swell again and close up tight. See cuts of these stave silos in our advertising columns.

Making Butter or Selling Milk at Skim-Station—Value of Skim Milk.

I am at present, milking ten cows. We have a skimming station 4 miles away, that buys milk by the butter fat test, paying two cents less than Elgin butter price for same.

Which would pay me the most, to make butter on the farm, selling at 20 cents per lb. or sell to the skimming station? Also, what is the value of skim milk per hundred, for feeding poultry and pigs? A. W. E.

Fosters, O.

It is fairly safe to estimate that under farm condititions, with a separator, that 8 lbs. of fat in the milk, will make 9 lbs. of commercial butter and that the cost in time and labor in hauling milk 4 miles, will fully compensate for the expense in making and marketing the butter. With this information before him our correspondent can judge for himself, better than we can advise, which method will be more profitable for him.

Skim milk when intelligently fed, should be worth one-half as much per 100 lbs. as a bushel of corn.

Clover Silage

Can I safely store clover hay in a silo, hauling the hay as soon as cut, and cutting only after the morning dew has dried off, simply tramping it well when putting in from the load?

I have a silo, have had one for 20 years, but must admit that for our system of farming, in this vicinity (Central New Jersey), I have often been in doubt about the profitableness of using it for storage of green corn. The principal reason for this uncertainty lies in the fact that filling the silo comes exactly at a period when men and teams should be engaged in plowing and cultivating for our winter wheat, or for seeding down to grass for following year's hay crop. With a small dairy, feeding ensilage has always with me involved more or less waste from molding. A large dairy eats it fast enough so that it doesn't have time to mold, and is all right.

I have never tried stroring green clover hay (without cutting) in silo. It seems, however, quite practicable. What do you say? A. T. T.

Franklin Park, New Jersey.

Clover has been made into silage very successfully. Formerly it was thought important not to put it in when wet with dew or rain, but with later experience, especially with corn, we should not be over particular in this respect. Experience seems to show that the best time for cutting is when about half the heads are in blossom. If cut later, water should be added, and in all cases it is expedient to wet down the top pretty thoroughly as soon as the filling is completed. It is also important to keep the clover well spread as the filling progresses, and thoroughly tramped, especially next to the walls. We are persuaded also, from our experience with corn last fall, that it is advisable to keep the walls well wet as the filling proceeds, as this reduces the friction and promotes settling.

Pea Vines for Silage.

Will you kindly advise me what you would think of filling a silo with ordinary pea vines? Do you think they could be used profitably in a silo? One of our dairymen claims to use them very successfully. SUBSCRIBER.

Kokomo, Ind.

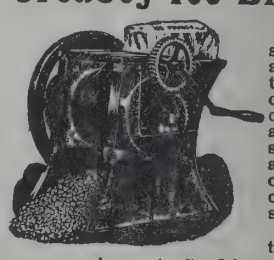
There is but little definite information on this subject. Practically all that is known came in the way of just such recommendations as "Subscriber" reports. Here and there parties who have tried siloing pea vines report satisfaction.

Wanted. Cows to Yield 400 Pounds of Butter Per Year.

I know very little about the different dairy breeds except what I have read in your valuable paper. I am not dairying now, but expect to commence in a small way in the spring. I am particularly interested in the Jersey and Guernsey cattle and would like to ask if in your opinion I can build up a herd of ten or fifteen cows as quickly and as surely by using Guernseys as I could if I was breeding Jerseys? I mean cows that will average 400 lbs. of butter a year. I would also like to ask how much heavier the average Guernsey cow is than the average Jersey cow? Also is it true that the Guernseys have larger and better shaped udders, larger teats and better placed than the Jerseys? J. H. H.

Council Bluffs, Iowa.

We apprehend it will be found a pretty difficult problem to build up a herd that would average 400 pounds of butter per cow, yearly, no matter what breed may be selected. Such herds come only after several years of effort and experience, and very persistent selection and weeding out. It is utterly impracticable to advise as to the breed to be chosen for such a purpose, except to say that one had best follow his personal preference, and then select animals for foundation stock that not only are up to his standard individually, but have the backing of ancestry with satisfactory records.



Guernseys will probably average about 100 lbs. heavier than Jerseys, but it cannot be said that they have larger or bet-

ter shaped udders, or better placed teats, although our observation is that the latter are somewhat larger. We feel constrained to say in this connection, however, that when one makes large and profitable production of milk his main purpose, he should not be over-particular concerning the style of udder or teats.

Plowing or Discing for Spring Crops—Alfalfa.

I have 25 acres corn stubble calculated for rye and oats which I didn't get plowed. Soil sandy loam, some places quite sandy, gravel subsoil, doesn't bake. Would you advise plowing next spring or working up with disc or springtooth cultivator? Want to try an acre or so of alfalfa; is there any seed raised in Wisconsin? Would it be better to get home grown seed or Turkestan?

Stevens Point, Wis. F. G. P.

If this corn was not ridged so much that the disc and cultivator will not level it, we should prefer not to plow in the spring.

We have not heard of any alfalfa seed being raised in Wisconsin. Turkestan alfalfa is still on trial and it is not yet certain that it will prove superior to common alfalfa for Wisconsin.

Death from Eating Young Sorghum.

ED. HOARD'S DAIRYMAN:—I noticed an article in Dec. 18th number headed, "A Strange Malady." Perhaps it might shed some light on the subject to tell you what effect sorghum has had on cattle and horses in this part of the country.

A neighbor had a piece of sorghum about six inches high. He opened the gate to drive his team through and five or six young cattle ran through and ate a little of the sorghum. Although driven out in a few minutes they all dropped dead inside of half an hour. Another neighbor had a cow that got into a patch of sorghum for about five minutes. He got her out and started to milk her when she dropped dead. Another man had two rows of sorghum about fifty yards long that his cattle had access to. This was second growth just springing up. Some six or seven head of grown cattle took sick. Their symptoms were first stiffness and staggering like they were drunk for a day or two; then seemed to get weak in the loins, then got down and could not get up, having lost the use of the hind legs. Not one of them got well. They had good appetites, eating as though nothing was the matter.

At another place where they feed sorghum it affects the cattle and horses the same way. Lately I was told by an old gentleman that it is arsenic. He says, "In some soils there is arsenic and the sorghum absorbs it and that is what kills the cattle. In land that contains no arsenic the sorghum is harmless. I should think it practicable to analyze soils and ascertain the facts."

I consider HOARD'S DAIRYMAN a most valuable stock paper. If hog-raisers will read and heed the article entitled Wise Words on Swine Husbandry, it will be worth many times the subscription to the paper. SOUTHERN CALIFORNIA.

Recent investigations seem to show that the poison in the second growth of sorghum is a compound of prussic acid, one of the most deadly poisons known.

From a Progressive Young Dairyman.

No Fear that He Will Not Make Dairying Profitable.

ED. HOARD'S DAIRYMAN:—Enclosed please find P. M. O. for $2.30 for one year's subscription for —— ——, one year's subscription for Fr. L., both P. O. ——, Wis, and 12 record sheets for 10 cows.

I was introduced to your valuable paper by Aug. Rutzen and after being acquainted with same I have done all I could to augment the number of subscribers, because I don't believe that anyone who is feeding two milk cows can do without your paper. —— —— always was one who would laugh about book farming, but now when F. L., J. K. and I, come together, and since he found out what we have learned through your columns he begged me to send in his subscription; and only a year ago he called us paper farmers.

I learned at our farmers' institute that 1 to 6 is a balanced ration. Now if you would teach us through your paper (young students in feeding) how much protein and carbohydrates there is in linseed meal, oats, barley, bran, middlings, timothy hay, clover hay, corn ensilage, corn stalks, corn stover and oat straw, couldn't we young students learn a great lesson to balance our rations? Won't it be a good thing to have record sheets for more than 10 cows? We want to learn all we can about dairying and get out of it all the money there is in it.

We have each from 8 to 16 milk cows, have bought a pure bred Holstein bull with extra good records from Wisconsin Live Stock Association, Appleton, Wis., for $100. On New Year's I am going to start weighing and testing every cow's milk, weigh all they eat and keep complete record of everything. By my statement you'll see that I am a very interested student. I have learned lots through your paper and want to learn lots more, to be sure and make success of it.

I have tried all my neighbors, but the most of them can't read English and consequently I have to be content with these two what I picked up again.

Please never mention —— —— his name if you publish this. Take out of it what you think most instructive and most to the credit of your paper. But at any rate please let me know about protein and carbohydrates.

Since I got introduced with your paper I have done all I could for it and will stay by it. MIKE MEULEMANS.

St. Croix Co., Wis.

O, that there were more Mike Meulemans to handle dairy cows in Wisconsin and elsewhere! There would be little complaint then that dairying does not pay, because there would be examples everywhere that the same kind of energy, studiousness and attention, which condition success in other occupations, applied to dairying insures success there. Reading, thinking, reasoning, and withal a wholesome appreciation of one's own ignorance, are the stepping stones to progress.

Mr. Meulemans will find on page 772 a table giving the amount of digestible protein, carbohydrates and fat in all the feed stuffs named by him, and in many others. If he has not preserved that paper and will write us again, we will take pleasure in sending him a duplicate copy. Meantime we suggest to him and his friends—and to all subscribers—that they make it a practice to preserve every issue of HOARD'S DAIRYMAN. To enable them to do this with most certainty and least trouble we have had binders made which will hold the fifty-two issues of the year and the index, making a most valuable book for future reference and reading. We sell these binders at 60 cents, barely enough to cover cost of manufacture, wrapping and postage.

DON'T PUT OFF

Seeing your friends and having them join in for a club of subscribers.

"ADVERTISEMENT."

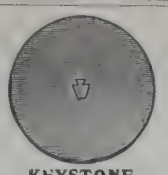
WORRY.

A Sure Starter for Ill Health.

Useless worrying (a form of nervousness) is indirectly the result (through the nerves) of improper feeding. A furniture man of Memphis says:

"About a year ago I was afflicted with nervous spells, would worry so over trivial things.

"I went to consult one of the best physicians in Memphis and he asked among many questions if I drank coffee.



"His advice was: 'Go to some provision store and get a box of Postum, drink it in place of coffee and as you are confined to your desk to a great extent try and get out in the open air as much as possible.' I followed his instructions regarding the Postum.

"At that time my weight was 142 and I was taking all kinds of drugs and medicines to brace me up, but all failed; today I weigh 165 and all of my old troubles are gone, and all the credit is due to having followed this wise physician's advice and cut off the coffee and using Postum in its place.

"I now consider my health perfect. I am willing to go before a notary public and testify that it was all due to my having used Postum in place of coffee." Name given by Postum Co., Battle Creek, Mich.

There's a reason for quitting the drug-drink coffee, and there's a reason for drinking Postum. Trial 10 days proves them all.

Look in each package for a copy of the famous little book, "The Road to Wellville."

Pork Production.

1. Where the ration fed was corn meal it took 4.6 pounds to make 1 pound of gain in 1901, 2.8 pounds in 1902 and 7.1 pounds in 1903, or an average of 4.1 pounds for the three years.

2. From the data presented under the table of rations used, it would be an easy matter to estimate the amount of food required for hogs of varying weights. Hogs fed in the ratio of 1 pound of grain to 3,6,9 and 12 pounds of skim milk made the largest gains on from 9 to 12 pounds of skim milk. The consumption of skim milk reduced the consumption of concentrates considerably, though the cost of a pound of gain was lowest with a consumption of 1 pound of grain to 3 pounds of skim milk. This shows that animals will often consume larger quantities of food than they can digest and assimilate with the greatest economy.

3. The largest gain per head per day was made by Groups III and IV, 1.40 pound, followed closely by Groups I and VI, with a gain of 1.35 pound. The other groups all gained 1.30 pound with the exception of the lot fed corn meal and water. The largest gains were made by the groups receiving corn meal and wheat meal, mixed in the ratio of 2 to 1, with skim milk. The ratio of grain to skim milk was 1 to 9 with Group III and 1 to 12 with Group IV. This ratio made the best gain but was not the most economical.

4. It required 140 pounds of concentrates and 1640 pounds of skim milk to make 100 pounds of gain with Group IV, which recieved 1 pound of grain and 12 pounds of skim milk. As the ratio between the skim milk and grain decreased the consumption of concentrates increased.

5. Group I, which received 1 pound of grain to 3 pounds of skim milk, consumed 80 pounds more grain than Group IV and 990 pounds less of skim milk, which makes it evident that the ratio of grain to skim milk was too wide in the latter group.

6. The value of skim milk as an adjunct in hog feeding is shown by the fact that Group V consumed 4.1 pounds of corn meal for 1 pound of gain, whereas, Groups VI, VII and VIII consumed only 1.6 pound of concentrates with approximately 12 pounds of skim milk per pound of gain. In other words, 12 pounds of skim milk saved 2½ pounds of corn meal.

7. The experiment indicates that a bushel of corn produced 13.6 pounds of pork, which at 6 cents would give it a feeding value of 81 cents a bushel; at 5 cents, 68 cents a bushel; and at 7 cents, a feeding value of 95 cents. A farmer often sells his corn at 40 to 50 cents, when fat hogs would bring him 5 to 7 cents per pound, under the mistaken idea that he can not afford to feed it. Corn has been purchased at 80 cents a bushel and fed at a profit at the station.

8. In the case of Group VI it was possible to secure 35 pounds of gain with a consumption of 416.5 pounds of skim milk. On the basis of the gain made from corn meal and water 416.5 pounds of skim milk made 21.4 pounds of gain when fed with corn meal. This would give it a feeding value of 31 cents when pork sells at 6 cents, of 26 cents when pork sells at 5 cents, and 36 cents when pork sells at 7 cents.

9. The manure from animals constitutes a part of the legitimate profits from any feeding experiment, as it takes the place of purchased commercial fertilizers, which are not so satisfactory. When 75 per cent of the fertilizer value of the food-stuffs consumed was credited to the animal, the average cost of a pound of gain for all groups was 3.7 cents; when no allowance was made for the manure, 5 cents. There is no reason why at least 75 per cent of the manurial constituents of the food-stuffs should not be returned to the soil under proper management, which according to these figures would reduce the cost of a pound of gain by 1.3 cent.

10. The highest gross cost of a pound of gain was with Group V, fed corn meal alone, 5.8 cents; or 1.4 cent more than Group I. The cost of a pound of gain was close in all instances and in no case was excessive.

11. The profit per group without considering the manurial value of the excrements was largest with Group I, $7.63; Groups II and III made a profit of $5.27 and $5.62, respectively; Groups VI and VII, $4.96 and $4.13; Group VIII, $3.38. The cost of soy beans in the case of the last group was probably responsible for the small profit shown, which indicates the importance of studying and utilizing those grains best adapted for the cheap production of pork. The price of foodstuffs has a marked influence on the profit from a feeding experiment.

12. These experiments clearly demonstrates the importance of skim milk as an adjunct food for hogs. The best ratio is one pound of grain to 3 to 8 pounds of skim milk.—*Tenn. Exp. Sta., Bulletin No. 3.*

Painkiller PERRY DAVIS'
The world-known household remedy for cuts, burns, bruises—coughs, colds, sore throat.

5.95 Stitched with Silk.

5.95 Buys a $16.00 Suit. Order Now or Write for our Large Free Catalog.

SEND NO MONEY WITH ORDER.

We have advertised in HOARD'S DAIRYMAN many years, and have found their subscribers among our very best customers, and to be conscientious and responsible. We are therefore going to make to the subscribers of this paper one of the most liberal propositions ever made, which is as follows: **This offer will not be made again. Order now.**

SEND NO MONEY Cut this ad out and send it to us. State number of inches around the body at chest, close up under arms, over vest, also number of inches around body at waist just above the hips, number of inches around body at (hips) largest part, also length of pants leg inside seam, from tight in crotch to heel, and we will send you by express this handsome black or dark blue suit **FREE** for inspection. When it arrives at your express office examine it carefully, try it on, and if you find it exactly as represented by us, strictly all wool, made in the latest style, and cut for season of 1904, to be a better fitting suit, better made, more serviceable, more stylish, and better in every way than any suit you can buy of any other house in Chicago, or in fact from anywhere else, or of your local dealer at home at less than $14.00 to $16.00, pay the express agent our special price of $5.95. If the suit does not prove to be exactly what you want, satisfactory in every way, equal to suits that sell everywhere at $14.00 to $16.00, then ship it back to us and we will pay the express charges both ways. Understand, we do not ask you to send us one single cent with the order. **All that is necessary to do is to send us this ad, give us your full measurements as indicated above, and say whether you want a black or blue suit, and we will ship you this handsome suit at once.** Do not be afraid you cannot take your own measure. Do not be afraid the suit will not fit you. Take your measure carefully and the suit will surely fit you perfectly. If it does not fit perfectly, if it is not satisfactory in every way, and the biggest bargain you have ever seen, and equal to suits that retail everywhere from $14.00 to $16.00 you need not pay one cent or take it from the express office, but you may send it back to us, we'll pay express charges both ways.

Our 15 Days Trial Proposition.

Wear this handsome suit 15 full days. In the meantime compare it with suits your friends have bought at home or elsewhere, and if you do not find our suit superior in quality, style and tailoring, and general makeup, and if it is not worth more than your friends have paid for suits at $14.00 to $16.00, return it to us and we will refund you your money, and pay all express charges so you won't be out one single cent. **Order today and wear a $16.00 suit at $5.95.**

THIS HANDSOME SUIT is made of a fine quality all wool cheviot, black or dark blue. Say what color you want when ordering. The coat is made in the semi-military fashion, round cut sack, like illustration; has broad padded shoulders, giving the shoulders a broad dressy effect; has double interlined canvas self-sustaining front, is neatly lined with strong farmers satin, has four outside and one inside pocket, vest is single breasted, made in the best of manner with notched collar, nicely lined. The trousers are made full medium wide, cut over the latest pattern. This is a suit that keeps its shape, and will give the wearer the very best service. We use in this suit better linings, trimmings, interlinings, stiffening and finish, than any other maker. We employ none but the very best of cutters and fitters, and we guarantee to give you a more stylish, a better made suit every way, shape and manner, than you can buy anywhere else without paying from $14.00 to $16.00.

OUR SPECIAL PRICE OF $5.95 Barely covers the cost of the cloth, lining, trimmings, and tailoring. **We are making this special offer merely to introduce our clothing in your vicinity and to place one of our catalogues in the hands of every subscriber to this paper.** We are only able to make this extremely low price because of our extraordinary facilities for buying and manufacturing, and because of our large volume of business, **Order today, and with the suit we will send you one of our large complete catalogues;** or, if you prefer a suit different from our special $5.95 suit, as described above, write us for our clothing catalogue. State in your letter the kind of suit you want and we will send you samples.

MARVIN SMITH CO. CHICAGO, ILL.

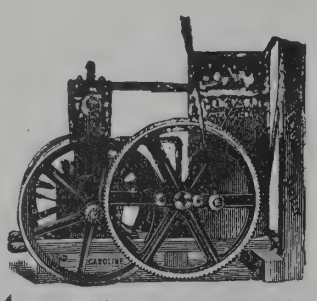
Salzer's Alfalfa or Lucerne

Glory enough! Ring the bells! Shout for joy! The year of jubilee has come! How's that! Why, sir, it has been made possible to grow Salzer's Alfalfa Clover in every state in the Union, North, South, East or West—why, sir, cold Minnesota and freezing Wisconsin, and treeless Nebraska, and the prairies of Illinois and Iowa, and the bottoms of Indiana, and the pineless soil of Michigan, and the rich farms of New York and Pennsylvania—yes, every state can grow from two to four crops of Alfalfa, if **Salzer's Northern Grown Alfalfa** seed is used! That's acclimated, that's hardy, that's tough, and we believe tougher and better than the Turkestan Alfalfa.

It's a Wonderful Clover

It's the greatest clover on earth, it's extremely early, the first crop cut in May, the second prodigal yield in July, the third in August, and lots and lots of pasture besides. It's great as a fertilizer, sending 10 to 25 feet after moisture and nourishment. It withstands drouth, wet, indeed, when once established it defies all elements, returning yields that will gladden the heart and fill the purse of every farmer growing same,

Look at This Testimonial



Carl G. Kleinstueck, Saxonia Farm, Mich., has this to say: "I have a patch of Salzer's Alfalfa Clover that I seeded 13 years ago, which yielded four big crops last year, besides good fall pasture. It has been cut three times already this season, and the fourth crop is about six inches high today, and will be ready for mowing in about three weeks."

We have hundreds like it coming from all parts of the United States. It will pay you, Mr. Farmer, to give Salzer's Alfalfa a trial.

For 6 Cents

If you will mention HOARD'S DAIRYMAN when you write, enclosing 6 cents in stamps, we will mail you a sample package of **Salzer's Northern Grown Alfalfa Clover Seed,** as also our catalogue that contains the full description of how to grow with success this wonderously luxuriant hay and grass producing plant. Send today 6 cents in stamps for above and be sure to mention HOARD'S DAIRYMAN.

Oils Cure Cancer.

All forms of cancer and tumor, internal and external, cured by soothing, balmy oil, and without pain or disfigurement. No experiment, but successfully used ten years. Write to the Home Office of the Originators for free book—Dr. D. M Bye Co., Drawer 505, Indianapolis, Ind.

DAIRY MARKETS.

ELGIN, Ill., Jan. 18—Butter ruled firm on the Board of Trade today at 22 cents a pound, a decline of 2c from last week, owing to a decreased demand. Sales in the region for the week were 435,900 lbs.

CHICAGO, Ill., Jan. 18—Butter—Easy; creameries, 15@21c; dairies, 13@19c.

Cheese—Steady; Daisies, 10¼@10½c; Twins, 10c; Young Americas, 10½c.

Eggs—Steady; at mark, cases included, 24@26½c.

Cattle—Choice to fancy beeves, 1,200 lbs. up, 5.50@5.75; good to choice heavy steers, 5.95@5.45; fair to good export and shipping steers, 4.40@4.90; medium beef steers, 4.00@4.30; plain beef steers, 3.65@3.90; good to fancy cows and heifers 3.80@4.75; good to choice feeders, 3.30@4.15; good to prime stockers and feeders, 1.85@3.25; fair to good cows and heifers, 2.90@3.75; good cutting and fair beef cows, 2.40@2.85; common to good canning cows, 1.40@2.35; bulls, poor to choice, 2.10@4.25; calves, good to fancy 5.00@6.25; calves, common to fair, 2.75@4.75; corn-fed, western steers, 4.10@5.40; Texas bulls and thin steers, 2.25@3.75; fed Texas steers, fair to choice, 3.40@4.40.

Hogs— Good to choice heavy shipping, 4.85@5.00; fair to good heavy packing, 4.65@4.80; rough and common heavy mixed, 4.45@4.75; assorted light, 150 to 185 lbs. 4.55@4.75; good to choice butcher weights, 4.80@5.00; fair to choice light mixed 4.55@4.80; thin to choice 50 to 135 lbs., 4.10@4.60; stags and rough lots, 3.00@4.40.

MILWAUKEE, Wis., Jan. 18—Butter—Creamery, extras, 24c; firsts, 21@22c; seconds, 18@19c. storage, extra, 20½@21c; storage, low grades, 15@18c; renovated (process,) 17@17½c. Dairy fancy, 17@18c; lines, fresh, 14@15c; roll, 14@15c; packing stock, 12c; whey, 8c; grease, 5@6c.

Cheese—American full cream, new: Twins, 10@10½c; Young Americas, 10½@11c; Daisies, 11@11½c; Longhorns, 11@11½c; low grades, 7@9c. Brick—New, fancy, 10@10½c; low grades, 7@9c; Limburger—New, fancy, 10@10½c; off goods, 6@8c Swiss—Drum, choice, 12@12½c; Drum No. 2, 10@11c; block, choice, 11@11½c; block, No. 2, 9@10c.

Eggs—Strictly fresh laid, loss off, cases returned, 28c; held fresh, candled, cases returned, 25c; strictly fresh laid, at mark, cases returned, 25c; storage, city, April No. 1, 25c; dirties and seconds, 20c; checks, 18c.

PLYMOUTH, Wis., Jan. 13—Cheese—Twelve factories offered 974 boxes of cheese, and all sold as follows: 142 Longhorns, 10¼c; 628 Daisies, 10½c; 182, 10⅝c; 8 Twins, 9c; 16 Americas, 10c. Next meeting, Jan. 26, 3:15 p. m.

SHEBOYGAN, Wis., Jan. 13—Cheese—Four hundred and ninety-six boxes of cheese were offered at the board today and sold as follows: 218 Daisies at 10½c; 6 Daisies, 10¼c; 15 Young Americas, 10½c; 12 Young Americas, 10c; 241 Longhorns, 10¼c.

SHEBOYGAN FALLS Wis., Jan. 13—Cheese—12 factories offered 540 boxes of cheese on the Call Board to-day and all sold as follows: 142 Daisies at 10½c; 389 cases Longhorns, 10¼c; and 10 cases at 10c. Market quiet. Next meeting Wednesday, Jan. 7.

NEW ORLEANS, La., Jan. 15—Butter—Extras, 23½@24c; firsts, 20c; seconds, 18c.

Cheese—Young Americas, 12c; Twins, 11c; Daisies, 12c.

Eggs—Fresh, 23c. Trade slow on all of above.

BOSTON, Mass., Jan. 18—Butter—Creamery, western, extra, 22@23c; western firsts, 21c; storage, 22c; dairy, 15@19c; western ladle, 14@15½c; box and print 16@24c.

Cheese—Choice, 12c; Wisconsin Twins, 10@11c.

Eggs—Fancy nearby, 36c; western 31@32c; fair to good, 28c; refrigerator, 28@29c.

NEWARK, N. J., Jan. 18—Butter steady at 22c.

Eggs—Firm at 30c, for western fresh, gathered firsts.

PHILADELPHIA, Jan. 18—Butter—Market steady. Solids 23c; near-by prints, 27c; western 24c.

TOPEKA, KANSAS, Jan. 16—Creamery—Butter 24@25c; Dairy butter 17½@18½c.

Cheese—Longhorns, 11½c; Daisy, 11@11½c; Prints 12c.

NEW YORK, Jan. 18—Butter—Recipts, 3,837 pkgs.; steady; extra, creamery, 22c; creamery, common to choice, 15@21½c; state dairy, 14@19c; held creamery, 14@20c.

Cheese—Receipts, 2,347 pkgs; steady; state full cream, fancy, small, colored, September, 12c; late made, 10½c; small, white, 12c; late made, 10½c; large, colored, September, 12c; late made, 10-½c; large, white September, 12c; late made, 10½c.

Eggs—Receipts, 3,128 pkgs; steady; state and Pennsylvania, nearby, averages, 31c; state and Pennsylvania, seconds to firsts, 28@30c; western extras, 31c; western firsts, 30c; western seconds 28@29c; refrigerated, 24@27c.

NEW YORK MARKET.

NEW YORK, Jan. 16—Butter—Receipts for the week, 32,389 packages. Exports for the week, 2,398 packages.

So far, January has been a hard month for the butter trade. Prices for fresh creamery have kept moving up and down every day or two, and these queer antics have about demoralized the retail trade; and yet the conditions have been about the same for the last two months.

There has been a big stock of summer butter hanging over the market, and packing stock from which renovated goods are made has been plentiful and low priced, and it would seem that a moderately low and steady price for top qualities of fresh creamery would be the correct thing and would lead to a freer use of "freezer" goods and less trade for "scab" butter.

Monday, extra fresh creamery sold at 24c and on Tuesday and Wednesday declined one cent per day, 22c has been the price since, and at the close there is no scarcity of any grade of butter and prices favor buyers all through the list. We quote:

Creamery, fresh, extra, 22c; medium, 20@21c; poor, 15@19c; creamery, freezer, extra, 20c; medium, 18@19c; poor, 15@17c; Dairy, extra, 19@20c; medium, 16@18c, poor, 14@15c.

Cheese—Receipts for the week, 21,682 boxes. Exports for the week, 8,642 boxes.

There is no change in prices and with perhaps a little more export inquiry for under grade full creams and best marks of skimmed cheese, the market is unchanged. We quote:

Full Cream, extra, 12c; medium, 10@11½c; poor, 8@9½c.

Eggs—Receipts for the week, 26,191 cases.

Market was steady all the week and closes bare of stock. Fancy new laid stock 32@33c; fair to good 28@30c; refrigerators, 23@28c per dozen. DAVID W. LEWIS & Co.

177 Chambers St.

BALTIMORE MARKET.

BALTIMORE, Jan. 14—Butter—While there has been no increase in the general receipts, the supply, with the single exception of fancy, fresh creamery, is fully equal to, if not in excess of, the requirements. The bulk of the current receipts are running very poor; there are but few, if any of the arrivals, but show some very objectionable features, which fact makes them very undesirable, and for the time being they are slighted, while on the other hand all receipts suitable for table purposes meet ready sale. There has been but little doing in June and other held creameries so far this week. Imitation creamery of choice to fancy quality is wanted. Fresh sweet ladles meet with good sale, while faulty stock is neglected. Rolls—There is a fair demand for fresh, sweet nicely-handled stock, while cheesy and roughly handled stock is very dull sale at irregular prices. Packing stock—The supply is fully equal to the demand. Prints and Blocks meet with prompt sale, when the quality is satisfactory. The general market, though about steady, rules rather quiet.

Creamery separator, extras, 24c; firsts, 22@23c; seconds, 19@21c: Held creamery, extra, 22@23c; firsts, 20@21c; seconds, 17@20; imitation creamery, extras, 19@20c; firsts, 17@18c; seconds, 14@16c; Iowa & N. W. Ladle, extras 16½c.; firsts, 15@15½c; seconds, 13@14c; Creamery blocks (2 lbs.) extras, 25c; firsts, 23@24c; seconds, 20@22c. Creamery prints, (½ lb.), extra, 25@25½c; firsts, 24c; seconds, 20@22c; Md. Va. & Penna. prints, extras, 24c; firsts, 22@23c; seconds, 18@20c. Renovated butter, extras, 20c; firsts, 18@19c; seconds, 16@18c.

Cheese—Market is a little firmer in tone, and earlier made and fancy cheese are bringing a slight advance over these quotations.

N. Y. State Cheddars, fine, 10½@11c; choice, 9¾@10c; fair, 9@9¼c; do Flats, fine, 11@11½c; choice, 10½@10¾c; fair, 9½@10c; do Small, fine, 11½@12c; choice, 10¾@11c; fair, 10@10¼c; Ohio Flats, fine, 10@10½c; choice, 9@9¾c; fair, 8½@9c; Ohio Picnic, fine, 10½@11c; choice, 10@10¼c; fair, 9½@9¾c; Swiss (Domestic) new, fine, 14½@15c; choice, 13@13½c; fair, 10@12c.

Eggs—Soon after our last issue, our market, in sympathy with others, took a drop. Stock that readily sold at 35 cents on Thursday, the 7th, would not bring over 32 on Friday, and towards the close of that day, 30 cents was the best price obtainable on fancy stock. On Monday of this week, the market opened in a very unsettled condition and sales were made at 27 to 28. Today with less liberal receipts, a better feeling prevails, and the market generally presents a healthier appearance at 28 cents. Now that the storage stock is well nigh exhausted, we look for an increased demand for fresh eggs and advise liberal shipments from now on.

301 Exchange Place. G. M. LAMB & BROS.

SAN FRANCISCO MARKET.

The butter market displayed considerable life yesterday and with a good local jobbing demand, sellers were able to advance prices a point, despite the increased receipts. Only a small percentage of really fancy creamery stock was included in the heavier arrivals, and there was a marked scarcity of the favored brands. Available supplies of the latter were quickly absorbed at the maximum quotation, while the average run of the fine grades of creamery were well cared for at the 28c rate. The intermediate and cheaper grades of butter ruled firm in sympathy with the improved market for the best stock and the offerings scoring highest in quality found an active demand at hardened figures. There was some movement in storage goods, but this stock was not a factor in the day's trade. The market for the fresh lines closed in a firm position for the selling interests. Easier prices prevailed for eggs under increased supplies and a cautious demand. The top quotation was an extreme for extra selected whites and posted buyers had little difficulty in filling their wants with good stock in the neighborhood of 32c. The cheaper grades of eggs were well cared for within the lower range of values. Prices for cheese were again quoted a fraction lower and under liberal supplies, the market continued easy in tone.

Receipts yesterday aggregated 40,500 pounds butter, 977 cases eggs and 8,200 pounds of cheese.

Butter—Creamery, extras, 28@29c; good to fancy, 25@27c; dairy, extras, 24@25c; dairy, choice, 21@23c; store, 17@18c; California storage, 21@22½; eastern creamery, nominal.

Eggs—Ranch, selected large, 32@33c; good to choice, 29@31c; store, 26@28c; California storage, nominal; eastern, nominal.

Cheese—California creamery, mild, new, extra, 13@13½c; mild, new, choice, 12@12½c: Young, America, 13@14c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.

READING NOTICES

All Reading Notices under this head are at the rate of 25 cents per line.

For Rent—A first-class Dairy and Grain Farm to rent on shares. No wet land. Enquire BOX 713, Whitewater, Wis. 50-2

Holsteins—Bull calves, at farmers' prices, sired by Dinah Johanna Sir De Kol. H. F. WEAVER, R. F. D. 3, Elkhorn, Wis. 50-tf

For Sale—Well established dairy in best and healthiest city in the South. Price $3,000. For full particulars address BOX 529, San Antonio, Texas. 50-4

For Sale—Guernsey bull, "Sir Neith" 8755. Dropped Aug. 18, '02; price reasonable. THOMAS S. MICHENER, Michener, Pa. 49-2

Richly Bred Guernsey Bull Calf—Nicely marked, strong and vigorous. Dam produced 603 pounds butter last year. Price low to quick buyer. H. R. NORTHRUP, Water Vale, N.Y. 49-2

Wanted—Man with family to work dairy farm of 160 acres, on shares. 20 Jersey cows. Sell to creamery or make butter at home. Silo, separator, teams, tools; everything complete except one team. A fair chance for an experienced man with little capital. Business established twenty years. Write at once to G. H. REDFIELD, the dairyman, Edwardsburg, Mich. 49-2

For Rent—For cash or on shares, my herd of 25 cows with land for their support, including 12 acres of alfalfa; 8 room house, garden and orchard. Milk route and equipment in town of 7000; retail 45 to 50 gal. daily; cash sales for 1903, $3350. Address ANDREW BALL, Mt. Vernon, O. 49-2

We will sell at public auction, to the highest bidder, the co-operative creamery, on the 8th day of February, 1904. NORTH FREEDOM CRY. CO., North Freedom, Wis. 49-2

For Sale—Combined cheese factory and store, three years old, good location in Chippewa Co. Will make now twelve hundred dollars per annum and will increase rapidly. Too many other duties to attend to it. Address "CHIPPEWA," care Hoard's Dairyman. 49-2

For Sale—At a bargain, two U. S. separators, turbine, 3000 lbs. per hour and No. 2½ 1300 lbs. A receiving vat, twin cream vat and churn capacity of each 400 gals., tempering vat and milk pump, 20 h. p. boiler and 10 h. p. engine. Eighteen months use. Address J. B. PRATT, Wellington, Ohio. R. F. D. No. 3. 49-2

A First-class, experienced butter maker desires a position in the West or Northwest. Up-to-date work guaranteed. Address A. TOBLER, Nora, So. Dak. 49-5

$25 to $50—Buys a highly bred Jersey bull from 2 to 20 months old. St. Lamberts, Stoke Pogis or Tormentors, from the best herd in Ohio. Write now to P. CLAWSON, Okeana, Butler Co., Ohio. 49-5

A Snap—Paying milk route at cost, for cash. Going west. Address S-7, care Hoard's Dairyman.

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D, Independence, Ia. 50-tf

Guernsey Cattle—All ages, both sexes for sale. Cir. free. CLOVER KNOLL GUERNSEY HERD, Orangeville, Pa. M. Sager, Supt. 41-tf

For Sale or Rent—Dairy farm of 200 acres, 90 improved. $1.50 per hundred for milk year around. Address J. P. SOUTHARD, Harbor Springs, Mich. 42-10

For Sale—10 cheese factories, 5 farms 40 to 160 acres, saloon, dance hall and store. FRED HADLER, 775 Ida St., Appleton, Wis. 43-tf

Buff Jersey's Third Revised Edition of the Dairyman Stock Breeder and Farmers' Hand Book; 10 chapters; The Buff Jersey Silo, how to build; Soil Crops; Dairy Cows, how to handle; Barns, how to build; Abortion, cure and preventative, and many other valuable things for progressive farmers. So popular has become the book that the author has concluded to make it an annual publication, and has put the price at a figure that makes it popular also. Postpaid, paper binding, 50c; cloth, 75c. BUFF JERSEY, Monmouth, Ill. 47-tf

Wanted—One single, and one married man with two grown sons for dairy farm. State wages expected. A. J. DAUGHERITY, Streator, Ill. 47-tf

For Sale—Choice reg. Guernsey bulls and bull calves. RAY C. BICKNELL, Ft. Atkinson, Wis. 32-tf

Herdsman Wanted—For Clover Knoll Guernsey herd, Orangeville, Pa. 48-3

I have a few Guernsy Bull Calves whose dam's and sire's dam have an average yearly record of from 643 lbs. to 747 lbs. butter. Individually they are desirable to head thoroughbred herds. CHAS. SOLVESON, Neshotah, Wis. 50-tf

A Good Dairy Farm of 360 acres for sale or rent; prefer to sell. Well watered with creek, springs and well. Good barns and two houses. 25 cows in milk. 3 two-year-old heifers to freshen in the spring. 1 bull. All high grade Jerseys. Situated in the town of Oxford, 1½ miles west of Packwaukee depot. A creamery at Packwaukee. N. W. ALLEN, Packwaukee, Wis.

Wanted—Loan on good improved farm for 5 or 10 years at 5 per cent interest. Address LOAN, care of Hoard's Dairyman. 50-2

Wanted—By honest young man, a position on small dairy farm to do general work. Can also milk. State wages paid. WM. G. MOYER, Center Valley, Pa.

An Unusual Opening -- Controlling milk trade of southern city of 35,000 in healthy upland region near the Blue Ridge Mountains. Suburban milk farm, up-to-date buildings, city water, dairy herd, teams, tools, retail stand in city centrally located and well fitted up. Trade well established. Prices good. Long season makes production cheap here. Owner disabled and will sell for $10,500 to close out. This is a fortune to a live man. Full particulars of "PIEDMONT" care Hoard's Dairyman.

Wanted—Position, with references. Married. Will milk 20 cows. BURT J., Box 453, Neillsville, Wis.

Dairy Questions Answered by Prof. Farrington.

A Creamery Refrigerator.

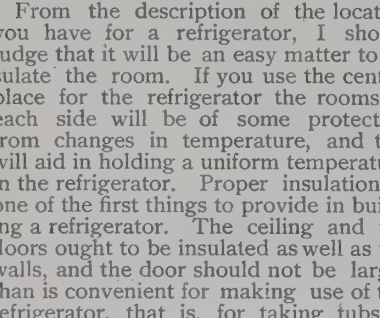
"Will you be kind enough to give us the latest and best plans for building a refrigerator that will hold about twenty tubs of butter? Our cellar has three divisions in it, separated by board partitions. Will it do to fill one division with ice and leave a center space in it properly made for a refrigerator?" * * *

Orangeville, Ill.

From the description of the location you have for a refrigerator, I should judge that it will be an easy matter to insulate the room. If you use the central place for the refrigerator the rooms on each side will be of some protection from changes in temperature, and this will aid in holding a uniform temperature in the refrigerator. Proper insulation is one of the first things to provide in building a refrigerator. The ceiling and the floors ought to be insulated as well as the walls, and the door should not be larger than is convenient for making use of the refrigerator, that is, for taking tubs of butter in and out of it. Every time the door is opened the cold air rushes out and the warm air goes in, so that the smaller the door and the less it is opened the better. I have heard some business men using rather large refrigerators say that every time the refrigerator door was opened it cost them fifty cents. This is probably an exaggerated statement, for the refrigerator of a creamery, but it gives one some idea of the necessity of keeping the refrigerator door open as little as possible.

The arrangement of the ice box of a refrigerator is a very essential thing as the dryness of the atmosphere in the refrigerator and the economy with which cold is obtained from the ice, will depend largely on the construction of the ice-box. The drawing enclosed gives a suggestion as to how this ice-box may be made. The principal point to be kept in mind in building this box is to have it so arranged that the air in the room will circulate around the ice. This will both cool and dry the air and by making an arrangement by which the drippings of the ice will be conducted out of the refrigerator, the room may be kept dry and cold. In the enclosed drawing the letters refer to the following parts of the refrigerator:

A. Is a door or damper which may be hinged at the top so as to control the circulation of the air over the ice.



B. Pieces of 2×4 placed edgewise on which the ice rests.

C. Galvanized iron or zinc drip-pans to catch the water from the melting ice and carry it into the gutter.

D. Gutter or drain pipe.

The ice is put into the box from the outside through a door made for this purpose.

This is a simple plan of a small but satisfactory refrigerator that has been used with good results in many creameries. It will prevent the accumulation of dampness which is one of the causes of mouldy butter, from which many creameries suffer heavy losses every year.

Question on Cream Testing.

I am the middle party between a creamery company and patrons. Am not satisfied with the system of operation. Do not feel that all concerned receive what they have a right to expect.

1. At what temperature Fahrenheit, does the graduation on a cream test bottle give the correct reading in percentage of fat in 18 grammes of cream?

2. What is the proportional difference in the volume of butter fat at 60 degrees F. and 120 degrees F.?

3. What is the exact weight of 18 c. c. of cream testing 25 per cent fat and 50 per cent fat at 60 degrees F. and at 120 degrees F.?

I understand that the richer cream is too thick under ordinary conditions, but I wish this information in order to force the use of cream scales instead of an 18 c. c. pipette. * * *

Brush Prairie, Wash.

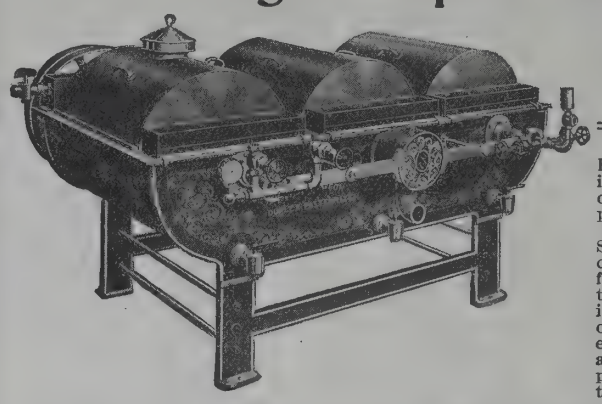
The graduations of the milk and cream test bottles are made so as to read the fat when it has a temperature of 140 degrees F. If the fat is warmer or colder than this the length of the column will be shortened or lengthened according as the temperature changes. From carefully made experiments it has been found that a change in temperature of 40 degrees will make a difference of .14 per cent when this difference in temperature is applied to the amount of fat that will fill the entire neck of the test bottle; that is, when it applies to a test of ten per cent fat. This difference of 40 degrees temperature with milk testing five per cent fat will make a difference in test of 0.07 per cent fat. These figures are based on the assumption that 18 grams of milk or cream are tested.

In the example given, asking what the difference in the test will be when the temperature varies from 60 to 120 degrees Fah., you may assume, on the basis of the above calculation, that for every ten per cent fat the variation in test between reading the fat at 60 degreès and 120 degrees F. will be about one-tenth of one per cent fat. It will not, however, be possible to measure the fat in the neck of the test bottle at 60 degrees F., because the fat will be solid at that temperature, and when it becomes hard, the crystals of fat do not fill the neck of the test bottle compactly, so that you can accurately distinguish the point at which to measure the top and the bottom of the fat column. If the difference in temperature of 40 degrees is taken between say 110 and 150 degrees, or two points at which the fat in the neck of the bottle will be liquid, the expansion and contraction of the fat due to these changes in temperature on milk testing five per cent fat will be, as stated above, .07 of one per cent. The test will read .07 per cent higher at 150 degrees than at 110 degree.

It has been found by determining the specific gravity of cream testing different per cents fat that cream having a fat test of 25.0 per cent has a specific gravity of about one, and this being the case your 18 c. c. of 25 per cent cream should weigh 18 grams. You must not assume, however, from this statement that the pipettes which have an 18 c. c. mark on them will always deliver 18 grams of cream. There is such a difference in the consistency of cream and the amount which will cling to the pipette as well as a difference in the amount of gas or air bubbles in different samples of cream that you cannot safely assume that an 18 c. c. pipette will always deliver 18 grams of cream testing 25 per cent fat. It is true, however, that if you can accurately measure 18 c. c. of cream testing 25 per cent and deliver it all into a small dish on a scale, the 18 c. c. ought to weigh 18 grams at a temperature of 60 degrees F.

The weight of 18 c. c. of cream testing 50 per cent fat is 17.7 grams. This is found by multiplying the specific gravity of cream testing 50.0 per cent fat, which is .983, by 18 c. c.

The difference between the weight and the measure of any liquid may be shown by multiplying the measure or the volume of the liquid in cubic centimeters by the specific gravity; the product shows what a given quantity of the liquid will weigh.



In this case then, 18 c. c. of cream testing 25 per cent fat will weigh 18 grams and 18 c. c. testing 50 per cent fat will weigh 17.7 grams when both weights are made at a temperature of 60 degrees F.

If the two creams are weighed at a temperature of 120 degrees F. the 18 c. c. of cream testing 25 per cent fat will weigh 17.7 grams, and the cream testing 50 per cent fat will weigh 17.49 grams. These figures are based on the following assumption: that full 18 c. c. cream is under consideration, and not simply the amount of cream that an 18 c. c. pipette will deliver; that the coefficient of expansion of water is .0004, of butter fat, .0003 and of cream it is .00035 and that the specific gravity of butter fat is 0.9. If the temperatures under consideration are 60 and 120 degrees F., this 60 degrees F. difference between them is equal to about 34 degrees C. Multiplying the coefficient of expansion of fat .0003 by 34.0 gives 1.0102, hence 1 c. c. fat at 60 degrees F. is eqnal to 1.0102 at 120 degrees F. and 1 c. c. of cream having a coefficient of expansion of .00035 is equal to 1.012. If now the specific gravity of cream testing 50 per cent fat is .983, 18 c. c. of such cream will weigh 18×.983 or 17.7 grams at 60 degrees F. and by raising this to 120 degrees F., the weight of 18 c. c. will be found by dividing 17.7 by 1.012 which gives 17.49 grams.

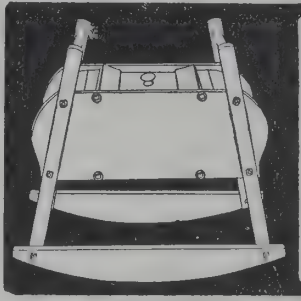
A Creamery Problem.

"We are paying three cents below Elgin for butter based on a test of 18 c. c. for cream with 11 % added overrun. It is assumed that the skim milk tests .02 of one per cent fat and this is the loss deducted. Do you consider this a fair

The Farrington Duplex Pasteurizer.

Built Entirely of Metal

Among the users of our Farrington Duplex Pasteurizers we have the names of the leading milk companies of the country.



The Farrington is not a Summer or Winter machine, but equally satisfactory at all seasons of the year. For convenience, durability, thoroughness of work and economy it leads them all. We are prepared to prove it. Write for further information.

CREAMERY PACKAGE MFG. COMPANY

General Agents Alpha-De Laval Separators.

Branches: Kansas City, Mo.; Minneapolis, Minn.; Waterloo, Ia.; Omaha, Neb. and Cowansville, Quebec. New England Agents: Stoddard Mfg. Co., Rutland, Vt. Pacific Coast Agents: De Laval Dairy Supply Co., San Francisco, Cal.

182 to 188 East Kenzie St., Chicago.

The ROCKER CHURN

Gets the butter from the cream down to the one thousandth part. Made of tasteless wood and the churning process is entirely the result of its own motion—no machinery inside or out to get out of order or require oiling.

Its Special Advantages

are: 1—Simplicity. 2—Least friction. 3—Gravity does the churning; a child can operate it. 4—Absolutely no adjustments, always ready. 5—Nothing but the churn box to clean, easily accessible. 6—Violent agitation of cream without paddles or dashers. 7—Gives the finest grade of butter of any churn on the market. WE PAY THE FREIGHT.

Your money back if not satisfied. In eight convenient sizes, 8 to 60 gallons. Price as right as the quality. Illustrated circulars free.

Rocker Churn Mfg. Company, Forsyth, Georgia.

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want."

DAILY MILK RECORD SHEET FOR TEN COWS

We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at the following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c

SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

MINNEAPOLIS, MINN.

When ordering mention this paper.

overrun and a just divison of the creamery receipts? Do you think better results can be obtained from an average creamery for all seasons?" * * * *
Downing, Wis.

From a creamery owner's stand point, I should think that the price mentioned in your letter, ought to be very satisfactory. I have been informed that a number of firms are paying the Elgin price for butter fat for cream and paying also for the transportation of the cream. This is a little better than you are paying, but I believe that the firms mentioned do not make all their cream into butter, but some of it is sold at retail or used in making ice cream. When such a market as this is available, a higher price for the products is obtained, than when the cream is made into butter. In such cases the buyer of cream can naturally afford to pay more than where butter only is made from it.

I do not think it wise to use an 18 c. c. pipette for testing cream. It is not always possible to deliver 18 grams of cream from an 18 c. c. pipette. If the cream is in a good, sweet condition and tests 20% fat or less, the 18 c. c. pipette. may answer the purpose. If the cream is a little ripe, so that it will stick to the walls of the pipette, and if it contains more or less air, such a pipette will not deliver 18 grams. The safest way of testing cream, is to weigh the amount to be tested each time into the cream test bottle. I will suggest that you make comparisons of tests of the same lot of cream, using an 18 c. c. pipette in one case and weighing samples of the same cream in another case, then compare the two results. I think this will show you the differences that you may expect from the two methods of testing.

A loss of two one-hundrenths of one per cent fat in the skim milk by a separator is an extremely small one. I do not think there are any separators in use, which will leave so small a quantity of fat in the skim milk during the entire run of a separator from day to day. The skim milk undoubtedly tests much nearer 0.1 than two-hundredths of one percent.

The overrun of 11 per cent is rather low if you are receiving cream only. This a fairly satisfactory overrun from milk, but that from cream would be somewhat higher. I think it will be a good plan for you to check up the testing at your factory and pay on the basis of the work done each week, rather than to use some definite standard of overrun, and skimming as a guide for the working of the factory each day.

[The laws of Wisconsin forbid the use of pipettes in tes ing cream—ED.]

TESTING RIPE CREAM.

"We have been unable to obtain an accurate sample of cream that has been ripened. We ripen in cans instead of in a vat. May I ask you if there is any way by which ripened cream may be correctly sampled and tested by the Babcock test?" * * *
St. Louis, Mo.

I think you will have no trouble in getting a fair sample and an accurate test of ripened cream if it is thoroughly mixed and then a sample weighed into a cream test bottle. Ripened cream is filled with more or less gas which develops during the ripening process, and this swells the cream somewhat so that a pipette full of it will hold considerable gas, as well as cream. This fact will, of course, make the results obtained by measuring the cream into a test bottle inaccurate, as the pipette will not deliver 18 grams which is the amount it is necessary to place in a test bottle, in order to have the graduations on the neck of the bottle show the correct results. If the cream which is added to the test bottle is weighed and the test completed in the usual way, the per cent of fat in the cream may be accurately calculated in the following way:

Suppose a pipette full of cream is emptied into a cream test bottle and by weighing the bottle you will find that 12 grams of cream had been added to it. The usual amount of acid is now added to this cream in the bottle and the test completed in the same way as a sample of milk is tested. The fat will separate in the neck of the bottle, and we will assume that the reading shows the fat in the neck fills a space corresponding to 15 per cent fat. This 15 per cent is now multiplied by 1.8 in order to find out how much this amount of fat will weigh. The result of the multiplication gives 27. If this is now divided by the weight of cream added in the first place, we will have 27÷12 or 22.5 per cent which is the per cent of fat the cream contains.

This subject is explained more in detail in the book, "Testing Milk and its Products," a copy of which I presume you have.

A STARTER INQUIRY.

"I should like to ask you a question in regard to how to make a skim milk starter for cream in order to make a perfect piece of butter. Sometimes my starter will be too ripe and other times not ripe enough. Will you please tell me the proper temperature I should use for cream and how long to hold it at that temperature? I should also like to know what temperature will be considered best to hold a starter after it is ready to use and until it can be placed in the cream? * * *
Black Hawk, Wis.

The making of a starter is not a very difficult matter when the principles which govern its use are well understood.

I presume you know that the usual routine is about as follows:

A carefully selected skim milk is heated to near the boiling point for about half an hour; this heating is supposed to destroy all the bacteria or germs which the milk may contain. This heated milk is then cooled to about 70° F., and to it is added an ounce of some commercial culture which is supposed to supply enough good germs to start a growth that will develop very fast and fill the entire quantity of milk with an innumerable number of these germs. This development of the right kind of bacteria is best promoted by keeping the milk at a temperature between 70° and 90° F. The milk is usually held at this temperature until it is near the curdling point and just before it thickens a starter is added to the cream in the proportion of about ten pounds of starter to 100 pounds cream. A small quantity of this starter is saved and added to a new lot of pasteurized skim milk, which is held at 70° to 90° until it becomes thick; then the second generation is used in the cream the next day as the first one. This treatment is repeated every day and, as long as the starter has a pleasant, sour odor and taste it will usually give a good flavor in the cream in which it is used.

If the skim milk is ripening too fast and you want to check the souring it should be placed in a refrigerator or in cold water, so that the temperature is lowered to 50° or less, as the germs will not grow when the milk is so cold as this. The efficiency of your starter depends almost entirely on your expertness in selecting a starter and being able to determine when you have devoloped an acceptable flavor in the butter. The inspection of a starter after it is made is fully as important as the making of it from a pure culture or from some milk which has been selected because of the particularly good flavor it contained.

Vermont Dairymen's Association.

Annual Winter Meeting—Large Attendance and Profitable Exercises.

ED. HOARD'S DAIRYMAN:—The 34th annual meeting of the State Dairyman's Association was held in the city of Burlington, January 5, 6 and 7. The sessions were held in the large City Hall, which during most of the time, was closely filled with a most attentive audience.

This convention immediately followed that of the State Sugar-maker's Association occupying, between the two, most of the week.

The first session of the Dairymen's Convention was held Tuesday afternoon. It was called to order by the president, George Aitken of Woodstock, and opened with an invocation by Rev. Geo. G. Bliss of Burlington. Succeeding this, addresses of welcome were given by Mayor Burke of Burlington and Ernest Hitchcock of Pittsford, member of the State Board of Agriculture. The Mayor, in the course of his remarks, stated that the work of this association is shown in the improvements that have been made in this industry in the state within the past thirty years. Vermont has always been at the front in this respect, and her dairymen should continue on in all that goes to make our state and nation great.

Mr. Hitchcock said that what the dairymen of this state now most need is not knowledge, but the putting into practice what they have already acquired and know; indeed, that they should not only be hearers only, but doers in the work. The president in his address stated that notwithstanding Vermont has long stood first in the dairying interests of this country, he thought there was yet much room for improvement, both in the quantity and quality of the butter made.

Reference was made to the good work accomplished in checking tuberculosis in the dairies of the state, but regretted exceedingly that there has been a necessity for discontinuing the dairy school. He referred to the importance of paying attention to the forestry question now being brought to the attention of the farmers of this country, as a matter that should not be lightly passed over.

M. W. Clark, of Williston, followed with a paper on "Dairying as a Special or Co-operative Industry." He thought that if more attention was given to this matter, that if dairymen were more united and earnest in their business, it would be more profitable to themselves and tend to keep the sons at home, and that there would be fewer abandoned farms in the state.

(It is said there are no abandoned farms in Franklin county, but perhaps there are in some other parts of the state.) He spoke encouragingly concerning keeping sheep and poultry on the farm along with the dairy, to help along with the income. One advantage in keeping sheep would be the improvement of the pastures, as good pastures have much to do with the best success in dairying.

The last address of the afternoon was given by Prof. J. W. Decker of Columbus, Ohio, who spoke interestedly on the subject of "Cheese Making." He gave valuable instruction in relation to the process of cheese making, and it would doubtless be well for the dairy interests of the state if more attention were given to this most profitable indnstry. Vermont should excel in the production of cheese as well as that of butter. Why not? Both are alike needed.

He stated incidentally that Vermont has the oldest dairymen's association in the United States, but cannot support a dairy school. Ohio expects to go before the legislature and ask for $80,000 for a school and equipment, and there is no reason why Vermont should not do the same. That is the way the index is now pointing. A prolonged discussion followed the address, showing the interest it had awakened. This concluded the exercises of the afternoon.

WOMAN'S AUXILLIARY.

The meeting in the evening was in the hands of the ladies, but for some reason they did not take much part themselves, but were a kind of "power behind the throne."

President Aitken called the meeting to order and introduced Mrs. R. L. Galusha of Royalton, president of the Woman's Auxilliary, who presided during the evening.

The large hall was closely filled with a large and appreciative audience.

Music was furnished during the evening by a male quartette, that rendered most excellent service.

Select readings were given by Mrs. G. H. Root, of Burlington, that kept the audience in the best of humor.

The first address was by Prof. J. L. Hills of the University of Vermont and Agricultural College, the subject being "Concerning the Vermont Dairy School." This was treated in a most earnest and convincing manner. The professor stated this school was established in 1891 and was the second dairy school founded in the United States. During its twelve sessions it had been attended by 600 students, the number each winter being limited to 50 on account of the limited accomodations provided.

But after this term of years, and the good success that has attended the work already done, it is found necessary to discontinue these schools. The reason for this is the fact that there is no suitable building in which to hold them. The building hitherto occupied, and which was furnished by the colllege, and not by the state, has become unfit for the purpose, and so the school is discontinued entirely, or until suitable accommodations shall be provided. Other states have provided liberally for this purpose and Vermont should certainly do the same.

The Professor had lantern slides giv-

POLLED JERSEYS
Richest Cow of all breeds in Pan-American Model Dairy. Winning Herd at Ohio and New York State Fairs, 1903. W. H. FORBES & CO., Yellow Springs R. R. No. 1, Ohio.

NAIAD OF ST. LAMBERT
Was a great cow. Aside from her official test she was a full sister of Mary Anne of St. Lambert (36.12 in seven days, 867.14 in a year) and her owner once refused $15,000 for her. Sale List A 21 contains a cow by a son of "Naiad", out of a grand-daughter of "Exile" with a weekly test of 19.10 and a milk record for one year of 11713 lbs., equal in butter fat to 739 9-10 lbs. butter. This cow is due soon to a grandson and great-grandson of "Naiad". Nearly all on this Sale List are deep in St. Lambert blood. It comprises fresh cows, cows nearing calving, heifers, and heifer calves. If interested write for pedigree of cow, and for List A 21.
WINTERGREEN HILL FARM,
SCOTTSVILLE, N. Y.

A. J. WELKER, ATTICA, N. Y.

ing representations of dairy and other buildings furnished by the other states, and ended by giving a most life-like portrait of our late honored and lamented senior senator in Congress, Hon. Justin Morrill, who succeeded in securing such liberal grants from Congress for agricultural colleges and experiment stations, not only for Vermont, but all the other states of the Union. Prof. Hills remarks were listened to with much attention, and it is believed will finally result in the resuscitation of the dairy school on a more permanent basis.

Senator Redfield Proctor being present gracefully responded to the call for remarks, and spent a few moments in expressing his interest in the meeting then being held, the great importance of the dairy industry of this country, as well as the good effects that are already becoming apparent in the operations of the anti-oleomargarine law that has for so short a time been in effect. This law has already reduced the use of oleomargarine over 40 per cent, and he looked for a still greater reduction.

At the close of his remarks the Senator introduced Hon. Gifford Pinchot of the Bureau of Forestry, at Washington, D. C. He occupied the remainder of the evening with an excellent address on "Forestry in New England."

As a result of the agitation upon this subject an organization was effected during these meetings to be known as the Forestry Association of Vermont, having in view the preservation of the forests of the state.

Following are the officers chosen: President, W. J. Van Patten, Burlington; Vice-President, E. C. Smith, St. Albans; Secretary, George Aitken, Woodstock; and Treasurer, Ernest Hitchcock, Pittsford. Executive committee, C. H. Green, White River Junction; J. A. DeBoer, Montpelier; and Joseph Battell, Middlebury. E. R. TOWLE.

Enosburg Falls, Vt.

(Report concluded next week.)

From An Enthusiastic Reader.

Has Profited from What He Has Read—Has Always a good Word for the "Dairyman"—Submits Ration for Review.

ED. HOARD'S DAIRYMAN:—Please criticise my ration as to feeding qualities: 2 lbs. Ajax flakes, $24; 2 lbs. corn and cob meal, $19; 2 lbs. bran, $21; 2 lbs. oil meal, $28.

My cows will freshen from February to July. They are all young with 2d and 3d calves. They give 8½ quarts of 32 per cent cream per day. I receive 26 cents for 22 per cent cream at creamery and receive extra for overrun in per cent. If you can give me a better ration, please let me know through your valuable columns.

That heifer I inquired sometime ago has come all right in the quarter—many thanks for your advice. That advice was worth ten times the subscription of the paper to me. I would not be without the paper so long as I keep cows, and if the price was $5.00 a year. I think I make up the subscription price every week, as compared with what I got before reading the DAIRYMAN.

I think I will have a larger list of subscribers when my subscription expires. I still have a good word for the paper when I meet a man that feeds cows for profit.

Can I feed 15 cows on 42 acres of land, every inch good, tillable soil; don't want to pasture? I want to mow the grass and feed in stable. I have an 8-acre pasture besides, for exercise for cows; very little grass is there for them, but running water.

February, my year is up, then I will send a report of my cows' doings, as I see all other subscribers shoot off their reports, E. S. S.

Jonestown, Pa.

We thank Mr. S. very sincerely for the foregoing expression of his appreciation of the DAIRYMAN, and hope by constantly increasing effort to deserve his continued confidence and good will.

We are of the opinion that our friend is feeding very liberally of grain, especially for cows expected to freshen before May 1, and he needs to be somewhat cautious about milk fever. If his cows are putting on some extra body fat, this may be considered a certain indication that it would be wise to reduce the grain, and we should be disposed in that event to commence with the "flakes" and corn and cob meal.

There is no question with us but what this correspondent can keep more than 15 cows on his 42 acres. Of course he may find it necessary to purchase some extra feed, but expense in this direction can be met with sales of produce not required for his family or cows.

$50 REWARD
WANTED FOR FORGERY

OBERLIN, KANSAS. Dec. 31, 1903.

A. Arwedson, a Swede, left here December 23, 1903. Age about 40. Weight about 145 lbs. Height 5 feet, 7 or 8 inches. Complexion light and sandy. Sandy beard; may be smooth-shaven now.

Nail on index finger of right hand grown over end and horny substance protruding.

Wide-open eyes, high eye-brows, teeth regular and well preserved.

Great talker; well posted on creameries and dairy work; apt to talk on this subject, Talks English rapidly, but with a Swedish accent.

Walks very fast, with a quick, jerky motion.

When last seen wore a brown melton double-breasted coat and a soft felt hat, creased through the middle.

In the Maritime Provinces.

A Two-Day Dairy Test.

ED. HOARD'S DAIRYMAN:—During the time of the Maritime Fat Stock Show, at Amherst, Nova Scotia, this month (December, 1903), a two-day dairy test was carried on. The competition was fair among the different breeders. The champion cow was a grade Short-horn, owned by W. H. Boomer, Amherst. The following is the score:

BREED.	OWNER.	Milk.	Fat.	Solids-not fat.	Total score.
Grade	W. H. Boomer	100.12	4.255	9.374	123.89
Ayrshire	F. S. Black	81.9	3.861	7.263	106.97
Holstein	Logan Bros	108.11	3.255	8.338	100.45
Jersey	J. E. Baker	65.6	3.591	6.185	99.36

THE MARITIME EXPERIMENTAL FARM DAIRY HERD.

The results of the year from the dairy herd at the Experimental Farm are at hand, and the showing is this year creditable indeed, and a great improvement over former years, as published by the writer in these columns. It shows that drastic weeding process has taken place and those "boarders", so common on Maritime dairy farms, have been wholly eliminated from the herd, so that now every cow pays her board bills and some to the good. With such an object lesson before the farmers of the Maritime Provinces they cannot say any more that dairying don't pay. When we consider the abnormally high cost of feeds at this farm—higher than any we have ever seen listed—the splendid showing of this herd reflects the highest credit on the Superintendent, Mr. Robert Robertson. Mr. Robertson is a worthy scion of the good dairymen of Auld Scotia, and a pupil of the Ness's of the eastern townships of Quebec, of whom he is also a most worthy kinsman. Robert Ness of Howick, Quebec, who judged the Clydesdales at the International Fat Stock show at Chicago this fall, and the foremost breeder of Aryshires and Clydesdales in the Dominion of Canada, is, we believe, an uncle of Supt. Robertson of the Maritime Experimental Farm, and, as Mr. Ness told the writer last fall, Robertson learned the principles of dairying and the breeding of dairy cattle from the elder Mr. Ness; all of which goes to show that successful dairymen are no sports, but is an inherited characteristic, brought to perfection in a dairy environment.

It will be seen by the tabulated statement herewith that the Maritime herd produced as much as $109.52 for the best, down to $49.66 for the poorest cow in the herd. When we consider the low price which the product sold for, this is indeed a splendid showing. And farther, when we consider the abnormally high cost of feeds the profits are creditable. The experiments are carried on, as Mr, Robertson says, for the purpose of determining whether a fairly good dairy herd, well fed and cared for, would leave a credit balance after paying for feed consumed and receiving credit for product at current prices. The different feeds were charged at the followiug prices, which all will admit, are very high: Wheat bran, $20; pea meal, $30; oats, $28; oil cake, $35; making an average price of mixed meal ration as fed to the cows, of $25 per ton. Roots were charged at $2 per ton, ensilage also at $2 per ton and hay at $7 per ton. The ration fed to cows in full milk in winter was:

Ensilage or roots, 50 lbs	$0.05
Mixed meal, 10 lbs	.125
Hay, 10 lbs	.035
Totals, 70 lbs	$0.21 per cow per day

In the summer months while milking they were charged $2.50 per month. When dry in winter they were charged $3 per month, and when dry in summer, $1 per month per cow. They were kept in the stable from November 1 to June 1, except on occasional fine days, when they were allowed out in the yard. The summer feed was practically all summer soiling with such crops as rye, clover, oats, peas, vetches grown in different mixtures and sown at different times. Eighty-five pounds of fat is the basis of 100 lbs. marketable butter, which however, is needless to say, is too low. The butter product was sold at eighteen and two-thirds cents per pound being the average of the year, while 15c per cwt. was the modest sum which the skim milk was valued at. The following table shows the results of the year:

NAME.	BREED.	Days milking.	Lbs. milk.	Per cent fat.	Lbs. butter.	Total credit.	Total cost.	Profit.

PASTURE VS. PENS IN SWINE FATTENING.

Another interesting experiment was to determine the economy of pasture, rather than pen feeding of pigs. The pigs were put in the test at 2 to 4 months old, in 2 lots of 10 each on July 1. They were fed on ration of 3 lbs. buckwheat shorts and wheat bran, and 5 lbs. skim milk. The results are as follows:

LOTS	No. days	Daily gain in pens	Daily gain in pasture
1	85	1.21	1.20
2	85	1.25	1.18
3	85	1.34	1.13
4	102	1.01	1.29
5	102	1.10	1.26
6	102	1.06	1.30
7	120	1.09	1.25
8	120	1.19	1.24
9	120	1.04	1.23
10	120	1.26	1.30

From the above, the only conclusion that can be taken, is that for short fattening periods of not more than 90 days, the pen fed hogs will make the greater gains. When, however, the feeding period is extended beyond 90 days, the pasture fed hogs make the greatest gains. In growing the so-called bacon hog for market, which is best at 180 to 200 lbs., it seems that it is probably best to pen-feed right along from weaning, say, at 10 weeks of age and not pasture at all. Such a hog should be ready for market at 6 months of age. All things considered it is our own firm opinion that hogs to be sold at a weight of 200 pounds, are best fed in pens having large rectangular yards, or lanes, and the green feed cut and carried to them. J. A. M.

P. E. I.

Why Should the Spirit of the Farmer be Sad?

ED. HOARD'S DAIRYMAN:—The magazine farmers make a farmer tired. They get on to some one's hobby and go-ariding for dear life. Just now some of them are wisely exploiting the wonderful possibilties of breeding corn so that about all the farmer will have to do at planting time will be to press a metaphorical button to produce a crop of corn, rich either in protein, oil, starch, pancakes, pone or hominy. So far they have not said much or anything about varieties bred to bring forth cobs especially suited for making pipes, or otherwise contributing to the domestic needs of the farm.

Of course, all feeders are after feeds rich in protein, but there are other elements in animal nutrition just as essential and really after all only so much cheaper than protein, because our corn has furnished them so abundantly. But when we shall be able to fashion the grains of corn so they will furnish by the one simple operation of their thousandfold reproduction, the one-time-much-sought-for "balanced ration" and leave us the cob to smoke, it will be the realizing of a fond pipe dream.

Just before the corn, they told us ever and ever so much about bacteria, bacteria of the vest pocket, yeast cake kind, dissolve it in a tub of water, sprinkle the solution on an acre or quarter section, and presto! double or quadruple your crops before you could say Jack Robinson.

The inoculation of the poor, heart sick soils is to cover the land with verdure and make the waste places get a move on them. No fear of our not being able to feed "the earth's teeming millions" now that they are breeding bacteria at Washington. There is something doing down there in other departments than the Post Office. Old man Malthus spoke too soon, he should have waited and seen what the magazine farmers can do.

Here in Pennsylvania we have a farmers' institute management that delights in having farmers told how they may reclaim worn out farms by the sinple and very cheap process of raising cow-horn turnips. The farmers take the doses

heroically but don't sow many turnips; and now the turnips will have to go out as the bacteria come in.

I have a friend who wanted to grow alfalfa. When he was ready to sow the seed he wrote to Washington for some governmental bacteria and received the reply that his land was too rich, that the bacteria were for poor land, that they grew lazy in rich land. Evidently they enjoy the strenuous life.

Before the bacteria we had the maccaroni wheat. It had been introduced by exhaustive research and great labor to the American farm and everybody could eat noodles with holes in them. The maccaroni was planted and grew and now we are told the supply has overlapped the demand and that there is more yield and better money in our simple old fashioned wheat.

Now just what application of radium these magazine farmers will make to our long suffering farms no one may guess, but they will probably tell us presently that a man may carry a little vial of it over a field and change the locked-up stores of fertility hidden in the soil into such active plant food as will astonish the oldest inhabitant.

As radium is likely to destroy any micro-organisms that may be around in the soil, the bacteria will have to be notified to take to the woods.

More recently still we have the comforting announcement that "berseem" (and that sounds mightily like something to drink) is to be introduced into various parts of this country from Washington, from which place we have the information that this plant has been the cause, all these mistaken years, of the extraordinary fertility of the valley of the Nile.

It appears now, since our searchers after agricultural novelties have taken observations over in Egypt, that the popular idea that that granary of the east was kept fertile by the overflow of the mystical river has been all wrong. As the greatness of Egypt was due to her agricultural possibilities and production, perhaps this secret of her never-failing fertility has been the secret the Sphynx has guarded all these years; if so, the Yankee professor has been too much for her and he has snatched the secret over here and with this to us new plant "berseem" we are going to reclaim barren land, smother weeds and maintain our fertility against the most careless farming practices.

It is scheduled to grow and luxuriate on both saline and alkaline lands and store nitrogen by the ton. In Egypt, the horses, camels, cattle, donkeys and peasants eat it and fatten and grow sleek upon it. Thus the money of the government spurs science on to bring us profit and amusement.

It is likely, however, in spite of all these new and great things we farmers will go on saving and spreading manure, planting and harvesting the good old Indian corn, our other grains and grasses. The newspapers and magazines will continue the enlightenment and felicitation of us, but no doubt unto the end, in the sweat of our brows shall we farmers earn bread. W. F. McSPARRAN.

Penn.

A Sanitary Milking Pail.

ED. HOARD'S DAIRYMAN:—A number of requests have come to me for a description of the milking pail devised by Dr. Rowland G. Freeman of New York City, to which I referred in my paper on "Market Milk" at the New York State Dairymen's Convention. Some of those writing have mentioned that they read my article in HOARD'S DAIRYMAN, and I have thought it might be agreeable to you to publish a brief description of the pail as follows:

An ordinary eight or ten quart milk serving bucket, having perpendicular sides and an opening in the top six or seven inches in diameter, has a tin visor or shield project upward and inward from one side of the rim around the opening. When the pail is in use it is held so that this visor is on the side further from the cow. The more the pail is tipped toward the cow the more will the visor project over the opening, thus affording protection against falling dirt. As every particle of dirt is liable to carry great numbers of bacteria with it, there is considerable advantage in excluding them in every practicable manner. The pail is a simple affair and can be constructed by any tinner. From my own personal experience with it, I know it can be readily used by any milker after he has once become accustomed to it. Sometimes milkers object a little at first, but after they have used the pail a few times no complaint is heard. Their chief grounds for complaint are that the construction causes difficulty in getting all the milk into the pail. After a little practice, however, this is found to be inconsiderable. R. A. PEARSON.

Ithaca, N. Y.

Hauling Manure on Rye Field in Winter.

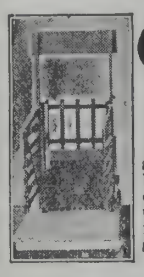
Will ask through your columns about taking manure to field in winter. Would you advise spreading it on rye field if no other suitable place, or leaving it in yard? This rye field is seeded to timothy, and red clover will be sown in spring. Land is in fairly good condition. Would, of course, like to take the manure out at this time of year, as we have plenty of time; otherwise, when left in yard when time is at hand to take it to field, we have all the work without this. SUBSCRIBER.

Whitelaw, Wis.

We see no objection to disposing of the manure as suggested, provided it is spread evenly and not so thick as to smother the rye. It might obviate some objections in this direction to go over the field early in the spring with a light, smoothing harrow.

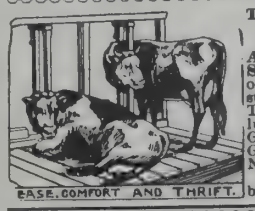
There are a great many hungry hearted women who would attend a baby sale if babies were ever offered for sale, because there are a great many wives who love children and have been told by physicians that they can never hope to nurse a child of their own.

Some of these women who have used Dr. Pierce's Favorite Prescription for the cure of womanly ills have been made happy mothers as a result of the cure of womanly disease and the building up of the general health.



Doctor Pierce's Favorite Prescription makes weak women strong and sick women well. It establishes regularity, dries weakening drains, heals inflammation and ulceration and cures female weakness.

"I wrote to you some time ago to get information about my case," says Mrs. Mary Lee Flanary, of Dryden, Va. "I was troubled with female weakness and pains. Received answer from you, advising me to take Doctor Pierce's Favorite Prescription and 'Golden Medical Discovery.' I took two bottles of 'Favorite Prescription' and found it did me good. I had been married four years and had no children; now I can say that our house is blessed with a little baby boy, born July 10th, by the help of God and your medicine. I praise your medicine highly.



"You can publish this letter if you wish."

FREE. Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send 21 one-cent stamps for the book in paper covers, or 31 stamps for the cloth-bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

THE NEW PATENT
Cow Stall
AND FEED TROUGH.

This is the only Cow Stall with a centering hinge. Stalls all fold back to manger as the cows go out the barn. When ready for use, by starting one stall all come into position. No post at the gutter. Send for circulars.

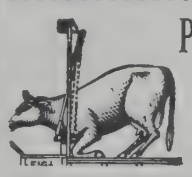
CHAIN-HANGING
CATTLE STANCHION
The Most Practical CATTLE FASTENER ever invented.
Manufactured and For sale by
O. H. ROBERTSON,
Forestville, Conn.

The "Penny Wise and Pound Foolish"

Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.
THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

Eagle 4 H. P. Stationary Engine
1904 MODEL



THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. Write for prices and description to
EAGLE BICYCLE MANUFACTURING CO.,
Engine Department. TORRINGTON, CONN.

WILDER'S
PATENT SWING STANCHIONS
Chain or Pin Fastened.
Are self adjusting and noiseless. Fasten themselves open when animal is out; swing freely when latch is closed; opened and closed without removing mittens or gloves; keep cattle clean with most freedom of motion; blind bolted and cannot get loose in joints; made of best selected hardwood and furnished with chains or pins as desired.
Safest, Strongest, Most Convenient
fastening made. Cheapest to put in and save room in barn. Send for Stanchion Catalog to

An Oregon Dairyman's Scheme for Feeding.

ED. HOARD'S DAIRYMAN:—Enclosed please find one dollar to renew my subscription for your paper. I also enclose market prices of grains, and I think oats is one of the cheapest and most economical feeds for this valley. We do our own grinding and generally mix one bushel wheat and two bushel of oats, or cheat seed; we also mixed broken vetch in and grind it. The bran you get here now is very poor stuff; some of my cows will not eat it. I consider oats, ground, worth per ton a good deal more than bran. I believe $30 per ton would be cheaper than bran at $18, and no hauling. We feed a bushel basket of corn ensilage twice a day, and cut hay and oat straw with grain besides; day times they are in pasture. Corn will grow here all right, but you cannot keep it unless you put it in the silo, or dry the ears in a drier. The fodder soon gets moldy. Next year I will put vetch and clover in the silo, and corn again in the fall. We generally have rain yet when clover and vetch are ready to cut, and there the silo will help out agaiu.

Lebanon, Ore. G. H. W.

The schedule of prices for grain did not reach the editorial rooms. Possibly it was mislaid in the business office, or possibly Mr. W. forgot to enclose, an oversight that sometimes happens with us. Good bran is worth only about 10 per cent less than oats, but poor bran is worth but little. Read what Mr. Gurler said about the palatability of feed stuffs. Feed that cows do not relish will do them but little good, for they will not eat much more than is required for maintenance.

The plan for disposing of the clover and vetch can be commended without any reservation.

CONCERNING OUR ADVERTISERS.

TREES AND PLANTS.

On another page will be found the advertisement of the Phoenix Nursery Co., 1300 Park St., Bloomington, Ill. This nursery is now in its 52d year of existence, and has been for over 27 years under the same proprietorship and management, and we can assure all our readers who may send to this company for trees and plants that they will be treated honorably and fairly in all dealings they may have with them. The fact that this company has been in existence so long is a guarantee that their stock has given satisfaction. During all these years they have sent out millions of trees and plants to all parts of the country. There are thousands upon thousands of orchards and gardens over the country bearing fruit from the trees and plants sent out by this company. There are also endless numbers of lawns and parks which trees from this company are beautifying today, and which speak for themselves as to the quality and class of trees and plants sent out by the Phoenix Company. Please mention this paper when writing them.

HOOD FARM ALMANAC—FOR THE STOCK OWNER.

One of the handsomest and most complete handbooks for the stock owner that we have seen is the Hood Farm Almanac for 1904. It contains 64 pages, larger than ever before, and every page presents something that is of interest and value to the stock owner. There is a valuable gestation table, monthly calendars, weather forecasts, etc., and a great amount of reading matter relating to common diseases incident to stock, with full description of the remedies that are proving most successful in curing them. The Hood Farm Almanac should be in the hands of every breeder and owner of stock and we advise every reader to send for one. Mailed on receipt of one 2-cent stamp by C. I. Hood Co., Lowell, Mass.

Our readers will observe an advertisement of silos made by the Kalamazoo Tank & Silo Co. This firm is really the old Williams Mfg. Co., who have been in the tank and silo business for a great many years in Kalamazoo, Mich., and we understand they changed their name on account of the new name carrying with it not only the name of the city where they are located and which is thoroughly well advertised, but it also carries with it the nature of their business. The Kalamazoo people put up two large silos last fall on the St. Louis fair grounds and they were filled with ensilage for the use of the American Jersey Cattle Club and also the Shorthorn Breeders' Association during the fair next summer. And in addition to the two large silos, they put up another silo to be used as an office, and this company extend a general invitation, we believe, to everybody to get around there to their office and occupy one of the rocking chairs when they visit the fair next summer. Every one knows that traveling around the fair grounds sight seeing, is very tiresome work, and we feel very confident that only a large number of our readers, but others, will be very glad to avail themselves of this rocking chair proposition.

COILED SPRING FENCE CO.

Very few fence manufacturers have enjoyed such a marvelous increase of business as that experienced by the Coiled Spring Fence Co., of Winchester, Ind. They inaugurated the system of selling direct to the farmer at wholesale prices, and have furnished a fence so completely meeting the needs of the farmers that the Company, as well as their product, has leaped into popular favor. It is certainly gratifying to enjoy the confidence of the farmer to such an enviable extent, and it is just as certain that nothing short of their excellent fence and square dealing could have won such a liberal patronage.

75c for Babcock Corn Planter. $10 One-Horse Corn, Bean and Garden Seeder. Drops in hills and drills 12 acres a day. Fertilizer extra. $28.75 Calumet check row planter with automatic reel and 80 rods wire.

$5.00 for this Gem Garden Drill With 11 tools complete $8.50 $2.20 for Wolverine Garden Cultivator. We have complete line garden tools. Seed Drills 65c.

$7.95 Steel lever harrow; cuts 10 ft; 60 teeth; two sections. $2.10 Steel Cultivator, plain, with 5 shovels, spreads to 33 inches.

80 cts. buys this seeder. Our No. 1428 Genuine Otis crank seeder, sows wheat, oats, grass seed etc. Retails at $3.00, our price $1.25. Michigan Wheelbarrow Seeder 12 ft. $4.95, 14 ft. $5.25. End Gate Seeder, improved pattern, $5.35.

$7.50 for Fanning Mill with grain outfit for cleaning wheat, rye, oats, corn, barley, beans etc. board for cheat and cockle. Clover, grass sieves extra. Warehouse Mills $23.50.

$6.50 buys perfect 100 egg incubator complete. $4.35 for 50 Egg Wolverine, Jr. Incubator. Brooders $3.15 and up. Handy egg carrier 28c, holds 1 to 12 doz. Root Cutter $3.25.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Shrinkage of Milk.

I have a Jersey cow that came fresh 3 weeks too soon, made no bag, afterbirth retained, which I removed. Calf lived and was vealed at 5 weeks; but where she formerly gave 6 to 7 quarts at a milking, gives only about 4 to 5. Health and appetite first-class. Feed 4 quarts shorts, 4 quarts of wheat bran and about 20 to 25 lbs. ensilage night and morning and dry fodder at noon. Can anything be given to stimulate milk yield? Also, last spring I bought a pairof 4-year-old chunky mares: lately one of them has gotten thin, dung is slimy and is physicky at times slightly, apetite good; have noticed they both pass long worms at times, and think this is probably the trouble. Feed hay morning and evening; for grain I feed when working, 3 qts. oats and 6 ears corn 3 times daily, a little less when they are idle; at that time I add a little bran.

Lycoming Co., Pa. T. L. J. REESE.

ANSWER.

1. The shrinkage of milk is due to the retention of the placenta which, as a rule, will affect a cow for 3 or 4 months after calving, especially if any part of same is allowed to remain, which has not been discovered by removing. Keep on milking and give good care and food and she will come all right with the next freshening.

2. Give the mares each, 6 drams of alloes, 20 grains of santonin and 1 oz. of turpentine in a quart of raw linseed oil, after complete fasting for at least 12 hours.

Failure to Come in Heat.

I have several two and three-year-old heifers which have never been bred, and which I would like to breed, but they all fail to come in heat.

In feeding nux vomica how long is the same to be fed? (State whether the same is to be fed daily or not with grain.) I am told nux vomica is a poison, and therefore hesitate using it until better informed. L. D. B.

Grimsby, Ont.

ANSWER.

If your heifers are in breeding condition, there is no reason why they should not come in heat. Perhaps these heats appear regularly, but escape your attention. If you could let a bull in a yard with them daily, they might begin to show heat sooner and be bred successfully,

Nux vomica contains from ¼ to ½ per cent of strychnine, which is a poison. But you are only advised to give a medicinal dose, say ¼ to ½ dram to your young heifers. once or twice daily in food. This will increase the sexual appetite, and need not be continued more than a week or two which is not dangerous.

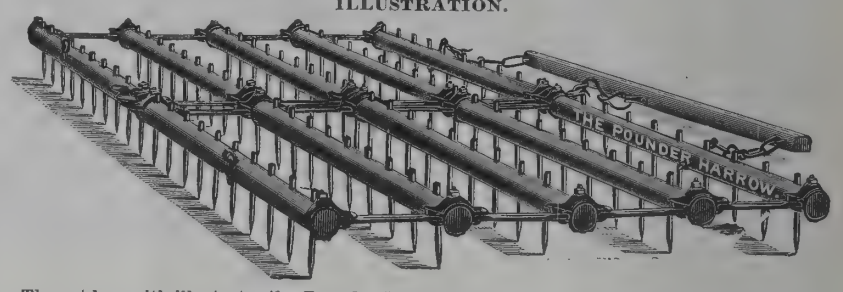
Bloat.

1. A healthy bull calf, 2 months old, bloated up one afternoon recently and soon died. I had been feeding it 2½ gallons warm separator milk per day, morning and evening, and on evening previous to the day on which it died, I gave it two small single handfuls of bran with the milk. Was death due to the bran or to the thick layer of froth on separator milk?

2. Have a cow, no particular breed. She has been milking nearly 8 months, and is yielding 12 to 13 lbs. milk per day. I am feeding her 7 lbs shorts, 10 lbs. carrots and 2 tablespoonfuls of a stock food, ————, per day, with a little salt; she gets a big armful of clover and timothy hay at night, and the same of red top hay in the morning. But her hair is falling out in patches. Kindly state cause and remedy.

3. Does the stock food mentioned above really produce any beneficial effect worth speaking of?

Abbottsford, B. C. W. A. C.



ANSWER.

1. It is not probable that either the milk or bran has caused the death, but that the calf was affected with some other trouble, which might have been discovered by making a post-mortem examination.

2. If the cow is otherwise healthy as you state, we would advise you to look for lice, which may account for the hair coming out in blotches.

3. Stock foods, as a rule, are not harmful to cattle. Usually they do some

ILLUSTRATION.

The cut herewith illustrates the Pounder Harrow that has for many years been manufactured in Fort Atkinson, Wis., by Geo. H. Pounder. The success of the Pounder Harrow has been very marked. The output of the factory is sold all over the country among those that are looking for something good in harrows. Mr. Pounder has a practical understanding of what is wanted in an implement of this kind which has enabled him to place on the market a harrow that has many improvements adding to its efficiency of service, durability and convenience. There is much said in Mr. Pounder's circulars that will interest intending buyers of this kind of an implement, and they can be secured by dropping a card to G. H. Pounder, No. 7, Fort Atkinson, Wis. The following letters from two prominent users fairly illustrates what the thousands of users of the Pounder Harrow think of it:

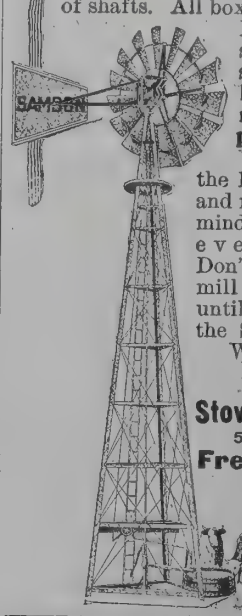
Bozeman, Mont., Dec. 18. MR. G. H. POUNDER: Dear Sir—I desire to advise you as to the work of the fifteen-foot Pounder Harrow purchased of you last year. We gave it a very thorough trial, as in irrigated lands much of the success is due to the perfect tilth of the soil previous to turning on the water, so that the soil may be equally moistened. We found nothing better for accomplishing this result than your implement, and if I were to use only one harrow I would select yours.

Yours truly, E. M. EMERY, Director Montana Agricultural Experiment Station.

Neponsett, Ill., April 8. G. H. POUNDER: Dear Sir—I have tried harrow putting in oats on heavy corn stalks, and it does first-class work and does not clog. My neighbor has been using it today and is much pleased with it.

Respectfully yours, J. F. BATES.

More might be said of this harrow, but if you are interested send for circulars.



Cutting Wood made easy with our Drag Saw

Worth its weight in gold to any farmer who has timber to cut. One at wholesale where we have no agent. We also manufacture a full line of Horse Powers, Wood Saws, Well Machines, and Saw Mill Machinery. Write for catalogue D and prices.

R. R. HOWELL & CO., Box H, Minneapolis, Minn.

SAMSON

No other name means so much to the man who seeks a good windmill in an understanding manner. The Samson is so made in design, material, workmanship and construction as to be the best windmill that it is possible to make. The Samson is the mill with the wonderful double gear which gives the strength of more than two ordinary mills in the single mechanism. This also provides for the longest shafting and the longest bearings, and places all working parts between bearings. These things mean perfect freedom from all torsion and overhanging strain—no bending or twisting of shafts. All boxes detachable.

Exceedingly sensitive to the slightest wind. It is the only real deep well pumping mill. We send free the handsomest and most complete mindmill catalog ever published. Don't buy a windmill of any kind until you send for the Samson book. Write today

HOOD FARM

Antiseptic

Breeding Powder

Makes Cows Breed After Abortion. Corrects Failure to Come in Season and Failure to Clean.

"I had a heifer that aborted her first calf and she failed to breed again, though three different bulls were tried. I decided to give Hood Farm Antiseptic Breeding Powder a trial. After one month's treatment the heifer was bred successfully and in due time she gave me a fine heifer calf for which I have been offered $25." JOSEPH MASON, Bacon Farm, Newton Highlands, Mass.

Price, $1, sent by mail, $1.15. Size containing four times this quantity, $2.50. Sent prepaid for $2.75. Address

ZENOLEUM

Famous *COAL-TAR* Carbolic Dip.

For general use on live-stock. Send for "Piggies' Troubles" and "Zenoleum Veterinary Advisor" and learn its uses and what prominent stockmen say about it. Books mailed free. All druggists, or one gal., express paid, $1.50; 5 gal., freight paid, $6.25.

ZENNER DISINFECTANT CO., 34 Bates St. Detroit, Mich.

IMMUNE HOGS Pigs made Cholera Proof for life by feeding sow Ridgway's New Vaccine. Costing 10c a litter. 500,000 tests successfully made. Written guarantee.

ROBERT RIDGWAY, Box V, Amboy, Ind.

Big Success With Hogs

SOME farmers are more successful with hogs than others. The man that only gets 8 lbs. of pork out of a bushel of corn fed to hogs makes only half as much as the man that gets 17 lbs.

The American Swineherd is a specialist and the best authority on the hog industry.

Prof. Henry says that success is only obtained by concentrating all efforts upon one line.

A two-years' course in hog raising.

Teaching how to be successful.

How to secure the greatest profits.

How to get 17 lbs. of pork out of a bushel of corn and 19 lbs. from a bushel of wheat-fed hogs.

How to feed to double the growth and gain over usual methods; only healthy hogs profitable.

How to keep your hogs healthy.

How to utilize, without other expense than the subscription to this paper, the costly experience and gathered wisdom of the most capable and successful feeders.

Prof. Kennedy of the Iowa Agricultural College says "Your paper is a leader in its line on feeding."

Every owner of hogs should take advantage of this special offer.

Send us $1 for two years' subscription to the **American Swineherd** and it will entitle you to a free copy of the Hand Book on "Hog Hygiene," with trade secrets, receipes, valuable information, etc. If the offer is accepted in ten days we will send you in addition the wonderfully suggestive picture in colors, "Uninvited Guests," suitable for framing, showing the pigs partaking of a meal uninvited.

This equips you for a successful hog business.

AMERICAN SWINEHERD,
535 Como Bldg., Chicago, Ill.

good, but the benefits derived from feeding same are all in favor of the manufacturer and dealer, not the stock owner.

Scours.

I bought a very heavy Guernsey cow and had her driven through the country ten miles. She became very much scoured and I have been unable to check it permanently. I have used salts 1 pound, which seemed to aggravate the trouble. I have used crushed rosin, which only relieved it temporarily. M. G. S.
Florence, S. C.

ANSWER.

You should not have given salts, as this will make her scour still more. Give a quart of raw linseed oil at one dose, then give tannic acid, salicylic acid and tr. of opium, of each 3 drams, in a quart of linseed tea night and morning until relieved.

Dropping the Cud.

One of my cows has thrown her cud, or nearly one-half of what she eats, for the last week or so. She seems to get thin and has ceased to give milk. O. J. H.
Hendrum, Minn.

ANSWER.

When a cow drops her cud there is usually something wrong with the organs of mastication. Make a careful examination of the mouth and you will no doubt find the cause, which must be removed.

Fistulous Withers.

Give me a simple treatmeut for fistulous withers through DAIRYMAN. This formed a bunch at side of withers about as large as an inverted saucer, and opened a few days since about 8 inches from top of withers, has discharged freely; bunch or enlargement has gone down and is now an open suppurating sore. L. H. E.
Font, Pa.

ANSWER.

It will do no good to attempt to heal up the opening of a fistula, as it usually heals upon its own accord, but only to gather and break open again in the near future. The only reliable remedy for such a fistula is to have it completely dissected out and treat the wound antiseptically afterwards.

Lice on Cattle,

Will you kindly publish in your next issue a remedy for lice on cattle, something cheap, so I can use freely? H. W. M.
Crewe, Va.

ANSWER.

Use Zenoleum or Chloro-naptholium as directed by manufacturers.

Skin Disease.

I have a bull that has some kind of skin disease, as he is all white around his eyes, and on his head seems to be a white dead skin or scrofula like. V. R. G.
Factoryville, Pa.

ANSWER.

Your bull has a skin disease which is of a parasitic nature. Wash the parts with Chloro-naptholium or Zenoleum according to directions on package and the trouble will soon subside.

Off Flavored Milk.

We have good Jersey cows; two of the best ones milk has become strong. They will not be fresh for about 17 weeks yet. They spoiled a good deal of butter. Can anything be done for it? We are going to give a physic this morning of salts. Should more than one dose be given to do any good and how often? MRS. F. R.
Middletown, O.

ANSWER.

By giving a physic of Epsom salts, 1¼ lbs. to a dose, repeated once or twice a week and a change in your food ration, we expect your trouble will be remedied.

Deformed Calves.

When the herd is infected with the abortion germs, it causes deformaties in the calves, as I have had 3 cases; one was born with the tail hanging a little on one side; the bone at the root could be plainly felt to be crooked. Another case this last year was a lump over the kidneys, giving the appearance almost of hump back. The 3rd and last is a deformed hock joint; seemed weak at first, standing on toes, is getting stronger now. MRS. M. B. M.
San Diego, Cal.

ANSWER.

The abortion germs have nothing to do with these deformities as far as is known at the present writing. This may happen to any cow whether she had aborted or not, the cause of which is not known.

Retention of Placenta.

If a cow retains her placenta after abortion, how is the best way to take it away, and is there any danger attached to doing so? P. W. J.
Old Point Comfort, Va.

ANSWER.

The best way to remove the placenta is to introduce your hand into the uterus and unbutton each and every one of the cotyledons to which the placenta is attached. Be careful not to tear off any of these cotyledons and make sure that all the membranes of placenta are moved, then flush the uterus with warm water and a half teaspoonful of permangenate of potash to a bucket of water.

An Illinois Creamery Statement.

ED. HOARD'S DAIRYMAN:—Following is the statement of the Central Illinois Creamery Co., for the year 1903:

Pounds of milk	3,246,603
Pounds of cream	38,313
Cream on same basis as milk would equal a total of milk	3,458,026
Pounds of butter	164,878
Pounds of butter fat	139,892
Average test butter fat	4.02%
Average test butter	4.76%
Average price paid patrons per lb. fat	22½c.
Total amount receipts	$35,824.55
Total paid patrons	31,527.31
Running expenses and salary	3,230.15
Dividend and sink. fund	1,037.40
Bal. due patrons	29.69

Paid stock holders 12% dividends.

I think we have one of the records, as the above was done with a 12 horse power upright boiler.

A. A. SHOEMAKER,
Butter Maker and Manager.
Nokomis, Ill.

Quality or Quantity.

ED. HOARD'S DAIRYMAN: — Which shall it be? In the next few weeks all over a great portion of our country are the great dairy conventions of every discription and it seems to me that in justice to the farmer as well as to the factory this question should receive a most thorough discussion as well as a decision as to what shall be done. If not the present three per cent law which was made for city and town milk delivery and is a just one for what it was made for. But it makes great injustice on innocent parties who are patrons of the many cheese factories all over a large portion of Wisconsin.

We have always contended and still do contend that the only just law for factory or patron was to pay by the test. It would have two results; to make better milk which means better cheese, and compel the dishonest man to be honest as well. There is a misunderstanding of the test by a great many which leads to the idea that factory men are always dishonest and that is, that they do not pay according to the test. This is a fact that is hard to make many a farmer see. This week's milk may test quite high, next week it may be quite a point lower, consequently the factory gets the name of being dishonest, but this is a side issue now. Every farmer should own a small Babcock tester and test his own milk. A general average could then be known.

Through a greater portion of Wisconsin the milk has always been pooled. The owners, or men who ran the factories, have never demanded quality if it was clean and sweet, but have put a premium on quantity regardless of anything else, or to the amount of fat in it, and it has also put a premium on dishonesty, and the cow that never ran dry or cost any feed, has swelled some milk accounts from $1.00 to $2.00 a day. And such men should get, and deserve all the state can give them.

But there is another class of farmers that the state is dealing unjustly with and making it a hardship and abuse by their interpretation of the law.

A large portion of the farmers in the cheese portion of the state in trying to produce the heavy flow of milk have crossed the common cattle with cheap Holsteins or a grade Holstein. Ignoring the idea of quality entirely, they have gotten the extra quantity and their herds have done well at the milk pail. It was all the factory men demanded; it was what they were paid to do. These men cannot change their herds in a month or a year, nor hardly in five years. It must be done by judicious care and breeding, as we all know it takes years to remedy these defects in our herds. Would it not be far better to demand a law that paid by the test than to persecute and prosecute innocent men? I have said to men again and again when I have tested herds that have gone down to 2.8 and 2.6 per cent: "Just as sure as fate, will the day come when you will get your pay by the test, and then the men who have stood for quality instead of quantity will be on top, because it will take you years to get the quality you lack now."

As the factories pay now, particularly in the brick cheese counties, and as the law is interpreted, the conscientious breeder for quality suffers just as much as he ever has. The dishonest man can put in water to the full limit of the law, and the honest men who give the milk just as Old Bossie gives it, be it 2.6 or 2.8 per cent, must be punished and fined to the full extent of the law, because poor old boss could give a good 14 quart pail of milk, but it was left out of her make-up to add more than 2.6 or 2.8 per cent fat in the bucket. A. W. LEHMANN.
Neosho, Wis.

For the Children.

To Keep Their Digestion Perfect Nothing is so Safe and Pleasant as Stuart's Dyspepsia Tablets.

Thousands of men and women have found Stuart's Dyspepsia Tablets the safest and most reliable preparation for any form of indigestion or stomach trouble.

Thousands of people who are not sick, but are well and wish to keep well take Stuart's Tablets after every meal to insure perfect digestion and avoid trouble.

But it is not generally known that the Tablets are just as good and wholesome for little folks as for their elders.

Little children who are pale, thin and have no appetite, or do not grow or thrive, should use the tablets after eating and will derive great benefit from them.

Mrs. G. H. Crotsley, 538 Washington street, Hoboken, New Jersey, writes: "Stuart's Dyspepsia Tablets just fill the bill for children as well as for older folks. Iv'e had the best of luck with them. My three-year-old girl takes them as readily as candy. I have only to say 'tablets' and she drops everything else and runs for them."

A Buffalo mother, a short time ago, who despaired of the life of ber babe, was so delighted with the results from giving the child these tablets that she went before the notary public of Erie Co., N. Y., and made the following affidavit:

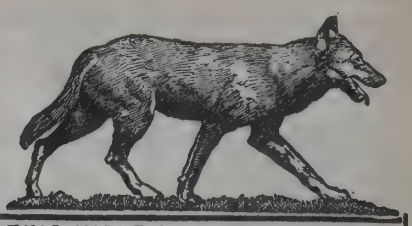
Gentlemen:—Stuart's Dyspepsia Tablets were recommended to me for my two-months-old baby, which was sick any puny and the doctors said was suffering from indigestion. I took the child to the hospital, but there found no relief. A friend mentioned the Stuart Tablets and I procured a box from my druggist and used only the large sweet lozenges in the box and was delighted to find they were just the thing for my baby. I feel justified in saying that Stuart's Dyspepsia Tablets saved my child's life.

MRS. W. T. DETHLOPE.

Subscribed and sworn to before me this 12th day of April, 1897.

HENRY KARIS,
Notary Public in and for Erie Co., N. Y.

For babies, no matter how young or delicate, the tablets will accomplish wonders in increasing flesh, appetite and growth. Use only the large sweet tablets in every box. Full sized boxes are sold by all druggists for 50 cents, and no parent should neglect the use of this safe remedy for all stomach and bowel troubles if the child is ailing in any way regarding its food or assimilation.



Stuart's Dyspepsia Tablets have been known for years as the best preparation for all stomach troubles whether in adults or infants.

FARM LANDS $9.00 to $14.00 PER ACRE

We were fortunate in securing a large tract of mixed timber and cut-over lands in **Polk County, Wisconsin,** in the midst of the hardwood belt, which a glance at the map will show is one of the best possible locations for agricultural purposes. We own several thousand acres of this first-class land, some of which is quite heavily timbered and affords the settlers the advantage of clearing a farm and paying for it with the proceeds, and also a large amount of hardwood cut-over lands which has been cut-over a number of years and are very easily cleared and made ready for farming.

These lands lie convenient to railroads, have good roads leading to them, convenient to schools and other privileges, and we offer them at prices and terms which are a very little higher than what is asked by other companies for land hardly equal in quality and a great deal farther from markets.

We also own several improved farms in size from forty to two hundred and forty acres, and some even larger. We have them in almost any stage of improvement, many having splendid lake fronts, and we are sure we can show a satisfactory farm to anybody looking for improved land. Write us today for maps, descriptive matter, etc.

Annual Record of Fifty Cows in One Stable and the Lessons They Teach.

[Address by H. B. GURLER, DeKalb, Ill., before the Wisconsin Dairyman's Association.]

[Continued from last week.]

DISCUSSION.

Mr. Goodrich: How did you get at the cost of labor?

Mr. Gurler: I figured that out several years ago, probably fifteen or twenty, and I have forgotten now the details of my figuring.

Mr. Goodrich: I can tell how I got at it. When I was making butter on the farm, I wanted to know what it cost a pound. I could get at the feed all right, but I was bound to tell how much the labor cost. People said that I couldn't do it, but you know I would rather hold the watch on the boys when they are working than to work myself, and so I got at it. I found that when I had twenty-five cows, the average time taken in milking a day through the year was five hours a day, two and a half at each milking; that is, if they were giving milk all the time, it would be ten cows to the hour, but it really averaged about eight cows to the hour. Then in feeding and cleaning the stable and doing the other work around and in cutting green food for them in the summer time, it averaged up at the end of the year three hours a day. That made eight hours. Then, in making the butter, that was done partly by my wife, of course, but her time was worth as much as anybody's, and that amounted to two hours a day, so there were ten hours a day, and that is a day's work, whether it is on the farm, or in the factory; so that it just figured up one man's work during the year. I would have had to pay $240 a year at that time and then I boarded the man, and I should charge the amount of his board at what it was worth, though not what some farmers think it is worth. I put in the board at $3.00 a week, and that made practically, all put together, $400 a year for one man and that figures out $16 per cow.

Mr. Gurler: But, Mr. Goodrich, I did not charge for making the butter, because I paid for that at the creamery, and after taking out of your figures for making the butter, you are pretty nearly on my basis.

Mr. Goodrich: It comes to $16 per cow and we made 300 pounds of butter.

Mr. Gurler: I am much obliged to you for helping me out, and I am confirmed on my figures because we come out so nearly alike.

A Member: Wasn't there any loss on the value of the cow each year?

Mr. Gurler: There has been on the average cow, for the last three or four years, until the last year. Last spring I was able to buy new cows to replace the culls out of my herd, with the money the culls brought, but, as a rule, there is a loss in the exchange. You can't get so much for a cow for beef as you will have to pay for a fresh cow, as a rule, and the better the cow the more loss, and that suggests another point. No one can afford to feed a dry cow. When you make up your mind you are going to dispose of a cow, get a little flesh on her and get rid of her as soon as you can after you have done milking her.

Mr. Scribner: That is all right for the milk man, but not for the breeder.

Mr. Gurler: I am not talking for breeders.

Mr. Favill: Don't your cows ever get old, so they have to stop breeding and milking?

Mr. Gurler: Yes; my cows wear their teeth all out sometimes, but I have got a registered cow in my herd now that is thirteen years old, and she is doing mighty good work. She made 400 pounds of butter for her first year's work as a heifer. You may be sure I am not going to dispose of that kind of a cow. I will keep her when her teeth are all gone.

Ex-Gov. Hoard: I have got such a cow as that, a registered Guernsey, sixteen years old.

Mr. Gurler: These good cows are just as liable to live to a good old age, if you take care of them.

Prof. Emery: I have a cow that at fourteen and one-half years gave fifteen and one-half pounds of butter in one week.

Ex-Gov. Hoard: A good cow will last longer than a poor cow.

Mr. Gurler: Yes, and the reason is that she has a great big constitution.

Mr. Favill: But you haven't answered my question yet. I had a cow that lived to be twenty-two years old, and when she was seventeen years old she dropped a calf that weighed 110 pounds.

Mr. Everett: What breed of cows have you, Mr. Gurler?

Mr. Gurler: Registered Guernseys, registered Jerseys and registered Holsteins; but most of my cows are grades—crosses. I am not going to get into any breed contest. I am talking about the individuality of the cows.

Mr. Everett: Do you depend on raising your own cows or buying them?

Mr. Gurler: I raise all the good heifer calves, but I have to buy a good many cows besides, and that is what breaks my heart, because I can't buy such cows as I want. Why, gentlemen, my two-year-old heifers, with their first calves are giving fifteen per cent more milk than the average cow I can go out and buy.

Prof. Henry: Suppose you have a cow on your farm that makes 200 pounds of butter the first year. What do you do with such a cow? Do you summarily dispose of her, or do you try her another year?

Mr. Gurler: It is not under all conditions fair to judge a cow from one year's work. You take the record of the cow's work with her general appearance, her make up, and you are pretty safe. A man can tell pretty well whether a cow has done her best or not, if he is watching her.

Ex-Gov. Hoard: If she indicates a capacity that she has not used, you are encouraged to hold onto her.

Mr. Foster: In this matter spoken of by Mr. Goodrich, of computing the amount of labor put onto the cow in the year, I think it is not quite fair not to charge up to the cow at least certain proportion of the time that is naturally wasted on the farm by the hired man. If we go into a machine shop, we are charged the rate of fifty cents per hour for the work they do for us, and the workman generlly puts in a certain amount of special work on us.

Mr. Goodrich: I think most of that should be charged up to the farm account, and not to the cow, because you have got to do that work for the cow every day in the year. It doesn't matter if it rains or shines, Sundays or week days, you do that work for the cow anyway. If you have got a lot of rainy, broken weather, the men don't do anything but care for the cows.

Mr. Foster: If you want to do that labor, all right; you increase your income. Now, I haven't got a family of boys to help me out with this work; my boys are all girls.

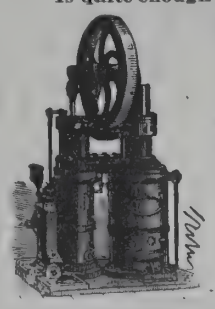
Mr. Gurler: When I bought the farm I am now on, in 1868, everything had been carried off for twelve years. I just worked for nothing, like working with 200-pound cows. I was forced to go into some other line of work. Now, here is a point that comes to my mind. You see on that chart the value of skim milk for the four best cows; the average value was $21.76 and the four poorest cows, $7.20. Now, there was a difference of $14.56 in the value of the skim milk.

A Member: In regard to the value of skim milk, how about feeding it back to the cows?

Mr. Gurler: Have you ever practiced that and is it profitable?

A Member: I have, yes. I never figured that thing out to see whether there was a profit, but I know I can increase the flow of milk very nicely by feeding back to the cow sweet skim milk. I can't tell whether I get more for the skim milk fed to the pigs than if fed to the cows.

A Member: Isn't it a fact that you often find that the poor milk has the most of the solids-not-fat in it?



Ex-Gov. Hoard: No, no.

The Member: I can show it to you in a chemical analysis of milk made by the Experiment Station in the state of Ohio.

Mr. Gurler: Let us not sidetrack onto that question now; we have too much to pick up already. Here is a matter of the rations that I fed those cows. I aimed to work to the German standard, that is, one to five and a half, and that ration that was fed for the year ending the first of September last was, one of protein to five and a half of carbohydrates and fat reduced to carbohydrates. I don't think I better touch that feeding question any further. I dislike always to preach when there is some fellow looking on that I know can do it better. I want to mention here again that question of palatability, for there is no question of greater importance. We may have a feed that will analyze all right, but if it is damaged in any way, or for any reason the cows don't like it, don't want more of it, don't

"Money Makers for Butter Makers"

Even though it were not apparent that

COLONIAL BUTTER SALT

AND

LIBERTY BUTTER SALT

are superior to all other kinds in flavor, color and purity, there would always be apparent the fact that they are superior in lightness, bulk for bulk. Take the barrel that holds 320 lbs. of the other man's salt; it will hold but 225 lbs. of Colonial Butter Salt. The usual salt barrel has a 30 inch stave and a 19 or 20 inch head. The Colonial barrel has a 34 inch stave and a 21 inch head, to hold the same net weight of salt.

The lightness of the salt makes it dissolve quickly and evenly and prevents washing out in the working, and if there is any value in the "make weight" theory, this salt stands at the head in that respect.

THE FLAVOR IS PERFECT
THE COLOR PERFECT WHITE

The purity over 99 per cent, hightest in the world. PROVE IT YOURSELF. To those who have never used Colonial Butter Salt (light, flaky grain) or Liberty Butter Salt (granulated) we shall be glad to deliver, free of charge, to creameries and cheese factories only, a 56 lb. sack of either or both, on request. We only ask, in return, that you report to us your actual success with our salt.

Won't you try it today.

COLONIAL SALT CO., AKRON, OHIO

CHICAGO OFFICE.....841 ADAMS ST.

Let Them Help Themselves.

They'll not take too much, and they'll get it as they want it. Don't force animals to eat salt when they don't require it, by mixing with food.

GREATER GEORGIA

GEORGIA Lands Grow Everything

GEORGIA offers the greatest opportunities to settlers and investors to be found in America to-day. It has been overlooked in the rush to less favored but better advertised sections. It is the ideal place for Northern farmers and their sons to locate. Grows all kinds of crops, make permanent and profitable homes, and all at a very moderate cost. The climate of Georgia is perfect, neither too hot nor too cold and is diversified as the land rises from the sea-level to an altitude of 5,000 feet. No blizzards, or violent extremes of weather. The best climate, in fact, to be found anywhere on the continent, for health and comfort with profit. Coal is cheap and abundant, educational and church advantages the very best, water plentiful, transportation facilities good. More than one-half the deposits in State Banks are owned by Georgia farmers.

LANDS in the most desirable sections of this wonderful state can be purchased on long time and at far lower prices than are asked in northern states. There is no more beautiful or fertile land outdoors than Georgia possesses in abundance. Ten months in the year there is open pasturage for cattle. So rich and fertile is the soil, so early and convenient the market, that farms here yield annually 40 per cent of their valuations. Failure of crops is almost unheard of in the entire state of Georgia, and where diversified crops are grown nothing like an unprofitable year was ever known. No better opportunity exists for poultry and dairy farming, cattle, hogs and stock breeding generally. Small fruits and in fact all fruits grow to perfection. GROW any crop here that grows in *your* state, and others that you cannot grow to profit. Ten cent cotton is like dollar wheat. Georgia peaches sell for millions. Finest grasses and open pasturage ten months yearly make dairy farming and cattle raising profitable. Don't misjudge Georgia just because you know little or nothing about it. ***Find out.*** Lay aside any prejudice you may possess and ask for facts, and then investigate for yourself.

Write **GREATER GEORGIA ASSOCIATION, Atlanta, Georgia,** and they will tell you

eat it with a good relish, they won't do their best. You are at fault, not the cow.

A Member: I eat a whole lot of things I didn't use to before I was married.

Mr. Gurler: And probably you are better for it, my friend; very likely your wife has got four times the sense you have, although you are a Jersey man and have probably got lots of sense.

Now, here is another point: There is a question in my mind, whether skim milk is not really entitled to all the increase that you can get from feeding grain feeds with it, over what you get feeding the grain feeds alone. Just go home and think about that. I don't want to deceive myself, nor you, but it is hard to get a feed that will take the place of skim milk.

A Member: I believe the gentleman's figures of the value of skim milk are substantially correct, and skim milk is worth more fed to pigs than anything else. I believe his figures as to labor are also substantially correct.

Mrs. Lehman: Supposing you fed that skim milk to the calf, would it be worth as much as you say?

Mr. Gurler: The calf does not show up here at all; but if fed to the calf it would be worth more. To a calf fed intelligently, skim milk is certainly worth 25 cents a hundred.

Mrs. Lehman: It makes a difference what kind of a calf.

Mr. Gurler: Yes, and it makes a difference what kind of a man. I told you that there is more difference in the men that feed the calves than there is in the calves.

Question: What amount of grain do you feed your cattle on the average?

Mr. Gurler; The average cow has been getting this winter a ration of ten quarts per day, composed of one part gluten meal—mind you, that is not gluten feed, it is gluten meal, analyzing 33 per cent protein. The gluten feed has the bran ground with it. My grain this winter has been 10 quarts per day, composed of one part gluten meal, one part wheat bran, three parts corn meal, with what corn silage and hay they would eat. This hay has been some of the time alfalfa; some of the time oat hay, and clover and timothy hay. This combination of grain weighs just about a pound to the quart. The wheat bran weighed 17 pounds per bushel; the corn meal, 50 pounds per bushel; the gluten meal, 61 pounds per bushel.

Mr. Goodrich: Then that would make more than a pound to the quart.

Mr. Gurler: It was not equal parts, you would have to take a pencil for that.

A Member: Wasn't that feeding a good deal of corn?

Mr. Gurler: It figured out a balanced ration, one to five and a half, and that is what I was aiming for. With this they were fed about forty pounds of silage.

Mr. Clark: Was the silage well eared?

Mr. Gurler: I don't know what you would call well eared. There was just about twice the amount of seed planted that you would put in for a grain crop.

Mr. Cobb: I am feeding the cheapest grain ration this winter that I ever fed. We are feeding six pounds of corn meal, three pounds of cotton seed meal, mixed, and a half a pound of cotton seed meal on the ensilage at noon, and it costs about three quarters of a cent a pound.

Mr. Gurler: What does your daily ration cost you?

Mr. Cobb: Three quarters of a cent a pound for eleven pounds. That is for cows that are giving 35 and 40 pounds of milk—besides roughage, of course.

Ex-Gov. Hoard: I am feeding 35 pounds of good corn ensilage, costing 4⅜ cents; 10 pounds alfalfa hay, .05; 3 pounds of bran, 2⅜, making a ration costing 11⅝ cents, for which I am getting over a lb. of butter fat a day, which I estimate to be worth at present prices, about 30 cents.

Mr. Cobb That is an ideal ration. Whenever we can get alfalfa in the dairy belt of this country, our fortunes are made.

Ex-Gov. Hoard: I am adding to that now about a cent's worth of cut corn stalks—dry, cut corn stalks, which would bring it up to 12⅝ cents.

Mr. Gurler: In this barn with the fifty cows, there were six cows among that fifty that made less than 200 pounds of butter per year, and there were seven that made over 400 pounds per year. The average of those seven was 440¼ pounds. Those poorest cows averaged 173.7 lbs. per cow. Two hundred pounds is the dead line down at my place. Unless I am satisfied that cow can do better in the future I dispose of her.

Mr. Foster: Were those six cows some of your best heifer cows, or some you had to go out and buy?

Mr. Gurler: Most of those cows were cows that I bought.

Mr. Favill: Do you mean the best ones?

Mr. Gurler: Yes. There was a period that I did not raise any heifer calves, but I have got a nice lot of young heifers coming up now.

A Member: Do you find gluten meal a better feed than distillery grain?

Mr. Gurler: I can buy protein cheaper in distillery, kiln-dried feed, than in gluten meal, but I was sidetracked by getting some that was not good.

A Member. We all got caught on that. They were putting in cob and sawdust down there, where cobs are cheap.

Mr. Gurler: The old saying that it costs no more to keep a good cow than it does a poor one is not always correct, but that point is of minor importance. We never have learned why it is that one cow will make fifty, or even 100 per cent more from the same feed than another cow, and it isn't necessary that we should know. We will let Professor Henry's force down at Madison find out why that is so. But certainly in the matter of care I am safe in saying it costs no more to care for a good cow than a poor one, but it is certainly more satisfactory to work with profitable cows than with poor ones.

You have all heard the old saying that the bull is half the herd. The bull is more than half the herd, because the females are more likely to be like the sire, and I care just as much to know about the record of the grandmother on the the sire's side as I do of the mother's record. The governor says it is more important, and I believe it. I say it is as important to know the butter record of the heifer calves' granddam on the sire's side as it is to know the butter record of the calves' own dam.

Now, from a strict business point of view I must talk a little. What other business is there in the world that would stand such abuse as is often given to this business in dairying? The lack of business methods which are generally applied to the dairying business is such that no manufacturing business would stand it at all without being driven into bankruptcy in six months. We have got in our town

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

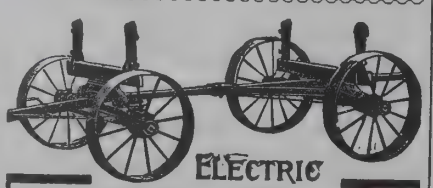
For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

YOU CAN....



BUY A FARM ON PAYMENTS

THE VALUE OF CHARCOAL

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

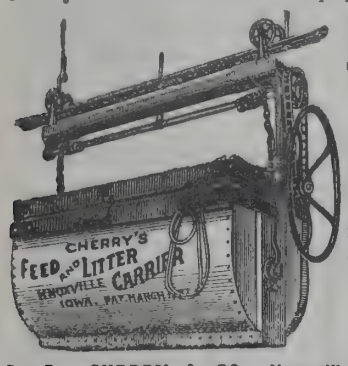
All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

large wire factories, that belong to the U. S. Steel company, and I have had men tell me how they are running the business of that corporation. I happen to know that the plant in DeKalb is producing wire at less cost than any other factory in the combine, and the key to the situation is to cheapen the cost of producing. If I could have as many cows as I have got now and have each one of them do what these four best cows are doing, I would get rich enough to quit business in a few years.

It seems to me that there are greater opportunities for the young men that are coming up now and are getting an agricultural education, than in any other field in this country. About a year and a half ago, there was an attorney came to my farm from Detroit. He had been down on the Atlantic coast, down to ——, (that 12-cents-a-quart man in New Jersey), and he came out to my farm for some ideas. He said to me, "I have got a son twenty-five years of age that I educated for the bar, and the young man commenced to practice law and he didn't like it; he stole away to some agricultural college and he is bound to run his father's 400-acre farm, twelve miles out of Detroit." And the father was looking around the country for ideas. He said, "I am going to fit up that farm and let that young man run it," and the last remark he made before driving out of my yard was, "Mr. Gurler, there are greater opportunities on the farm than in any of the professions." It was a professional man who said that, and there is no question in my mind but what that is true. If the young men here will go to studying and thinking along that line, by the time they get up to my age there will be nobody in this country looking down on them; every profession will be looking up to them, and they will think, "You are the lords of creation," and you will be—but you have got to put your mind into it.



Prof. Henry— Mr. Chairman, Ladies and Gentlemen: My mind goes back to twenty-two years ago last month in this city when I met a body of farmers in the month of January, 1881, talking of agricultural matters. There are some gentlemen in this room who were present at that meeting. One man came to me and he said, "Professor, I have got an eleven-year-old son that I am going to send to your school." I said to him, "That is the first student that has been promised to my school since I came into the state, and I am grateful for it." That was Mr. A. J. Decker, of your city; his son was J. W. Decker, who is now Professor of Dairy Husbandry in the Ohio State University, and a very honored man in the profession. There are a good many of your citizens with us in Madison now, but it was not always so; Mr. Decker's son was at that time the only student I had. I worked ten years and at the end of that time had only twenty-six students. This year we have over 460. Now, I would like to have all the young men here who have attended at Madison in the Dairy School and in the Agricultural course and the short course, to stand up, so we can see who they are.

Mr. Gurler: There are enough for a starter.

Prof. Henry: There are cheese instructors, there are dairymen, there are helpers all through the community. I know there must be at least four or five farmers here who have sons that they want to have interested in the college, and I would like very much to talk with them about it. I attended a farmers' meeting last winter at a little town in Dane county, and I said there "I am going to get some students out of this meeting this winter, and I did. We have seven young men from that county.

I have got places for ten thousand young men at better pay than they are now earning if they will come and study with me and prepare themselves. All I want is good, well-bred boys, willing to work hard, and the positions are waiting for you. If you want lawyers up here, I can send you up a carload.

DENCE & MERY, 111 Mery Block, Toledo, O.

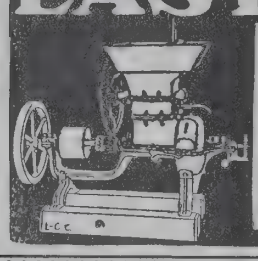
Made for the Man Who Wants the Best.

The Great Western Manure Spreader

Endless Apron

spreads all kinds of manure, fresh, well rotted, fine, coarse, hard, mixed, full of straw, full of corn stalks, etc.

Will also spread **compost, lime, land plaster, salt, wood ashes, cotton seed and hulls,** and in every case do it quicker, better and more evenly than it can be done by hand. Spreads as much manure in one day as twelve men can load and spread by hand and the job is much better when done. Spreads the largest load a team can haul in 2 to 4 minutes. It makes the same amount of manure go three times as far and at the same time produce better results.



REGULATED to spread much or little while in motion. Puts it on thick on poor spots—3 to 25 loads per acre. **ENDLESS APRON**—always ready to load. No turning back into position with crank.

COMBINED HOOD AND END GATE keeps manure away from beater while loading and acts as hood in spreading. Catches all flying sticks, stones, etc. Front wheels cut under, and machine can be turned in its own length. Made in two styles and four sizes. Capacity 30 to 70 bushels. It saves **time, labor and money** and will double the crops. Makes all manure so fine and spreads it so evenly that it is immediately available for plant food.

LARGE CATALOGUE 10 by 13 inches, with 8 large cuts shows the spreader perfectly and describes it fully. Tells also how to apply manure to secure best results. **Mailed free.**

SMITH MANURE SPREADER CO., 16 & 18 S. CLINTON ST., CHICAGO, ILL.

for its equal. Wind power doubled. Two 14 ft. wheels work on same pinion; second wheel gives more power than first. **A governor that governs in all winds.** Develops 10 full h. p. in 25 mile wind. All power needed for farm, shop machinery, pumping, irrigating, etc. for $1.00 a month. Ask for Booklet 8. Ask about Armsaver Husker.

Double Power Mill CO., Appleton, Wis.

HANNA BARLEY SALZER'S SEED NOVELTIES

SPELTZ MAC WHEAT OATS BROMUS ALFALFA &c.

SALZER'S NATIONAL OATS.

Hear, farmers of America, lend me your ears, while I chant the merits of this new Oat Novelty.

Editors, Agricultural Writers, Institute Orators, all talk and write about this new Oat. It yielded in Wis. 156 bu., in Ohio 187 bu., in Mich. 231 bu., in Mo. 255 bu. and in N. D. 310 bu. per acre, during 1903, and in 1904 you can grow just as easily 300 bu. per acre of **Salzer's National Oats,** as we can. Your land is just as good, just as rich and you are just as good a farmer as we are. We hope you will try this Oat in 1904, and then sell same for seed to your neighbors at a fancy price, next fall.

Macaroni Wheat.

It does well on arid, dry lands, as also on rich farm lands, yielding from **30 to 80 bu. per acre.**

Speltz and Hanna Barley.

Greatest cereal food on earth. Yields 4 tons elegant straw hay and 80 bu. of grain, as rich as corn, oats and wheat ground together! Does well everywhere. Hanna Barley grows on dry, arid lands, yielding 60 bu. per acre.

Salzer's Home Builder Corn.

Positively the biggest eared early corn on earth, yielding in Ind. 157 bu., Ohio 160 bu., Tenn. 198 bu., Mich 220 bu. and S. D. 276 bu. per acre. It is really a marvelous corn. Sinks its roots deeply after moisture and nourishment and grows like a weed.

Bromus Inermis and Alfalfa Clover.

Bromus Inermis is the most prolific grass for permanent pastures on earth. Yields 7 tons hay per acre. Good on sand, lime, clay, gravel—yes, on all kinds of soils!

Alfalfa Clover produces more hay and better hay than any Clover known. It is good for 7 tons per acre.

Potatoes 736 bushels per Acre.

The Editor of the RURAL NEW YORKER says, "Salzer's Earliest Potato is the earliest out of 58 early sorts tried, and yields 464 bu. per acre, while Salzer's Early Wisconsin yielded for them 736 bu. per acre. Salzer's Potatoes for yield challenge the world!"

FOR 10c IN STAMPS

and the name of this paper, we will send you a lot of farm seed samples, including some of above, together with our mammoth 140 page illustrated catalog. Send to-day.

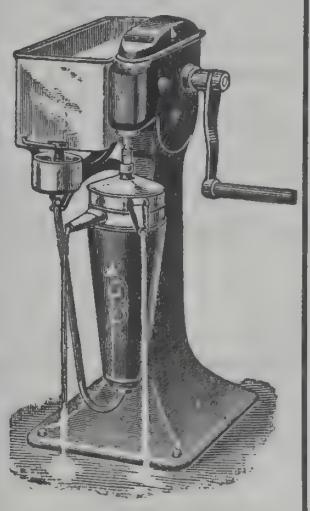
General Agents Alpha-De Laval Separators.
Branches: Kansas City, Mo; Minneapolis, Minn.; Waterloo, Ia.; Omaha, Neb. and Cowansville, Quebec. New England Agents: Stoddard Mfg. Co., Rutland, Vt. Pacific Coast Agents: De Laval Dairy Supply Co., San Francisco, Cal.
182 to 188 East Kenzie St., Chicago.



The ROCKER CHURN
Gets the butter from the cream down to the one thousandth part. Made of tasteless wood and the churning process is entirely the result of its own motion—no machinery inside or out to get out of order or require oiling.

Its Special Advantages
are: 1—Simplicity. 2—Least friction. 3—Gravity does the churning; a child can operate it. 4—Absolutely no adjustments, always ready. 5—Nothing but the churn box to clean, easily accessible. 6—Violent agitation of cream without paddles or dashers. 7—Gives the finest grade of butter of any churn on the market. WE PAY THE FREIGHT.
Your money back if not satisfied. In eight convenient sizes, 8 to 60 gallons. Price as right as the quality. Illustrated circulars free.
Rocker Churn Mfg. Company, Forsyth, Georgia.

A POEM YOU MUST KNOW

The above heading appears in the "Waterloo Courier," Waterloo, Iowa, as an introduction to some lines contributed by R. H. McNally who had just returned from Fairmont, Minn., where, during the State Dairymen's Convention, the **Sharples Tubular Separator** won an overwhelming victory over three competitors. Here is the poem:

You creamery men and dairy men,
I pray you attend a while
Unto these lines that I have penned
For they'll cause you to smile.

Concerning a dairy battle fought
In a Minnesota town
Between the Sharples and three other machines
That are losing their renown.

A Sharples man made statement
In words both loud and tall,
He could cut in two the skim milk test
Of anything in the hall.

The others jumped upon the seats
And said it was not true
And would not stand such gross abuse
From anyone they knew.

They then wrote up a challenge
And sent the Sharples out of hand,
It stated that no such machine
Could before them ever stand.

Our boys smiled and then replied,
"We'll meet you one and all,
And let you know the Sharples
Can drive you to the wall."

The challenge we accepted
And the money they put down,
And we met in deadly conflict
In the creamery of the town.

They call unto their disc machines,
"Exert your skill and try.
Our life, our credit and our cash
On you we do rely."

Then spoke the Sharples boys
In words both loud and high,
"The Sharples, when the test is through,
Is the only machine to buy.

We care not for the brags you make,
We mean to let you know
The Sharples boys are winning cards
Wherever they do go."

With courage bold, undaunted,
The Sharples stood the field,
The skim milk test decided all,
The others were forced to yield.

And when the judges made report
And their report we knew,
The Sharples cut the test of all,
More than two times in two.

With honor now we wear the belt,
The others are beat and down.
They wish they had not met us
In that Minnesota town.

Mr. McNally's enthusiasm can be well understood by reference to the skim milk test as follows:

TUBULAR	.05
U. S.	.125
DE LAVAL	.175
EMPIRE	.450

It should be borne in mind that this contest was run in the presence of, and the results attested, by Robt. Crickmore, A. W. Trow and E. J. Henry, three well known authorities in dairy matters.

ELMCO ELMCO ELMCO ELMCO ELMCO ELMCO ELMCO ELMCO

We are not interested in talking to feeders who can't figure beyond cost price.

ELMCO Feeds are not cheap feeds in any sense of the word. They are milled for results and only interest feeders who feed for results. The mill offering low priced feed is generally simply offering inferior feed; for it is reasonable to suppose they are asking all they feel it is worth.

First class feed cannot be made from second class wheat or by a slighted milling process. The best grades of hard Spring wheat, properly milled, make profitable feed. Damaged or immature wheat, or wheat improperly milled, contains too much fiber and moisture. It can be sold at a low price because the wheat does not cost much and the milling process is cheap.

In comparison with feeds analyzed by the Mass. Experiment Station, **ELMCO** Feeds show the following superiority:

CHEMICAL ANALYSIS

	ELMCO Feeds		Other Feeds		ELMCO Superiority	
	Prot.	Fat	Prot.	Fat	Prot.	Fat
Wheat Mid'l Flour	19.38	5.43	18.20	.5	1.18	.43
Wheat Mid'l Standard	20.00	6.15	17.19	.5	2.81	1.15
Mixed Feed	17.90	5.13	16.18	4.5	1.72	1.8
Wheat Bran	16.63	4.78	15.17	4.5	1.46	.28

We trust in your good judgment and discrimination to prefer **ELMCO** Feeds. Ask us for samples and prices. Ask your Banker as to our reliability.

A Case Where Ignorance is Bliss.

ED. HOARD'S DAIRYMAN:—I have read the DAIRYMAN with great interest and seem to take more interest in it than in any other paper. So I send you this clipping from the *Packer*. I have fed lots of potatoes for the past 3 years and I don't see any bad effects yet. But the *Homestead* had an article saying: "They seem to help the milk flow for a while, then dry the cows." I was much pleased to see Thompson's letter in the *Maine Farmer*, from Ft. Atkinson. I am desirous of building a silo, but I can do pretty well with roots.

Caribou, Me. F E. D

The Packer is a paper published in New York City, and we take the liberty to transfer the entire clipping to our columns as a typical illustration of the ignorance which rules in too many city editorial rooms. It looks very much as though the 'butter experts" were "guying" *The Packer* man and found him an easy subject, both as to the general quality of butter and the deleterious effects of the winter (?)feeding of rape and "silo."

Following is the article with its original scare head lines:

CREAMERYMEN CUT OUT SILO.

AUTHORITIES SAY IT CAUSES POOR QUALITY BUTTER.

WINTER MAKE BUTTER COMING FROM WEST TO NEW YORK THE WORST IN YEARS—BAN PLACED ON SUCH FOODS BY DISTRIBUTERS.

NEW YORK, Jan. 2.—The highly praised rape and other modern concoctions for the feed of beef cattle, milch cows and other live stock it seems, is the direct cause of the poorly flavored butter, which, this winter, is coming from the Western creameries. This *The Packer* man finds is according to the opinions of several butter experts in the New York trade.

There is no going behind the fact that the winter make of butter by the Western creameries this year has been unsatisfactory to the Eastern trade. Beginning with the late fall the receivers in New York began kicking. The stock for the most part sent in here as extras by the creameries whose makes had always gone unquestioned to the city trade fell far below the usual winter grade. These receivers could not account for it, and if it was merely suggested that silo, rape, ensilage or such feed was the cause of the deterioration in the make, they would not listen to it. Not until prodded by the commercial side of the question would they acknowledge that the off quality of the stock was caused by the food given the cows.

Silo is the much vaunted feed for the economical Western dairy men. In one county in Minnesota on 15 farms silo is fed and it is said that next winter the same county will have 30 dairymen feeding silo. Throughout Illinois, Iowa, Wisconsin, Indiana as well as in the Central, Southwestern states silo and rape have lately come to be acknowledged the principal winter food. The agricultural colleges are principally the cause of this.

In the Eastern states, New York for instance, this kind of feed finds little place on the farms of dairymen. The heaviest milk distributers in the United States, a company which is now called the trust, has long ago placed a ban on silo and kindred feeds. This company will not, under any circumstances, handle the product of the silo dairymen. Consequently the growth of the use of such feed has been discouraged in New York which is the largest butter producing state in the United States, save Iowa.

To illustrate the discrimination against silo and silage, the latter a recently coined term for the former, a small advertisement appeared in several up state papers recently It offered dairymen a certain price for their milk and added "no questions asked." The company which placed this advertisement was seeking the patronage of farmers who fed silo and whose milk was rejected by the company whose chemists pronounced milk of silo fed cows unfit to go into the human system.

Silo is a cheap feed. It is composed of fodder originally grown for the purpose. Naturally green corn stalk and other vegetables when packed, its juice brings it into a succulent state and it is relished by the cows. It makes butter fat. So does rape. It also makes cattle fat. So does rape.

Ensilage is made from silo. An Illinois authority in an address at the recent Iowa buttermakers' convention, said that the rape that cows eat does not affect them internally, but that in passing through the field the odor clung to the body of the cow which at times caused such odor to be discernible in the butter. A New Yorker who had read the address and was talking to the *Packer* man of the matter, said he wondered if passing through an onion patch would cause the odor of onions to cling to a person, creating a stronger odor than if the person ate the onions.

The winter make of butter coming to this market has been the poorest in years. Creamery men shipping their stock here under the grade of extras are somewhat surprised when they receive their returns from the dealer who writes them that their stock graded no better than firsts and in many instances seconds.

Receivers here have been besieged for explanations. The makers wanted proof and in every case they got it. In nearly every instance their poor product is caused by rape, silo and ensilage. That is what butter men who have spent 30 and 40 years in the business say, so there must be something in it.

Mr. Wheaton's Canadian Dairy Notes.

The Ontario Dairy Convention—Testing Milk for Adulteration and Impurities—Improvement in Factory Equipment—June Milk and Cheese Quality—Preserving and Transporting Cheese.

Ed. Hoard's Dairyman:—The first of the big Canadian dairy conventions took place at Belleville, Ontario, on Jan. 6-8. It was the twenty-seventh annual gathering of the Dairymen's Association of Eastern Ontario, and was a record one, both as regards the attendance and the interest in the proceedings. Matters of vital importance to the future of the industry were discussed.

President Derbyshire, in his opening address, reviewed the year's business, which had been a most successful one. He estimated that the output of cheese in 1903 would bring into Canada no less than $28,000,000 and of butter $7,000,000. If to these figures is added $16,000,000 for bacon, we have a total of $51,000,000, or $7,000,000 more than in 1902. These are large figures and as contrasted with the total output of only five years ago, show the remarkable development of this, Canada's greatest agricultural, industry in recent years.

The president then touched upon the future. His aim was high. Danish butter is regularly quoted ten shillings higher than Canadian creamery in the British market, and English and Scottish cheese sell regularly eight to ten shillings higher than Canadian. By proper handling of the cows, keeping them in well-ventilated stables with good wholesome food and pure water, and adopting cleanly and careful methods in caring for the milk in making the manufactured article and getting it to the consumer, Mr. Derbyshire claimed that Canada could soon reach the high standard of Danish butter and English cheese.

He strongly deprecated the making of winter cheese. The cheese factory should close the first of November and the winter creamery open, making butter till the following May. This would give a full season of six months for cheese making. This would equalize the product and keep off the market goods that are not strictly fancy.

The dairy cow, her care and feed, was well presented by Mr. Henry Glendinning of Manila, Ont. Economy was the first point to be considered, but not false economy, for the amount of milk depended on the amount and quality of food. The aim should be to induce the cow to eat as much as was healthy. Most farmers, he claimed, underfeed. He recommended the following as a good ration for a dairy cow: Corn ensilage, 40 lbs; clover hay, 10 lbs.; pea meal, 4 lbs. and wheat bran 4 lbs.

Mr. J. A. Ruddick, chief of the Dairy Division, Ottawa, introduced two important matters passed upon at the Ottawa dairy conference last November. One referred to the need of three grades for cheese and butter instead of the two, finest and under finest, that existed at the present time. This would encourage the production of a first-class article and furnish an incentive to the man producing a fine article to do better. There is at present a good deal of difference in the qualities classed as finest, and the producers of the very finest grade do not get all the credit they might. The other matter was that cheese factories and creameries should be placed under a provincial license, in order to insure proper sanitation, drainage, curing-rooms, etc., that would help to enhance the value of the product.

HOLSTEIN BULL, SIR BERYL DE KOL.

JESSIE VEEMAN, H. F. H. B., 36579.
Property of Stevens Bros., Lacona, N. Y.

A resolution was passed by the convention approving of the principle of licensing cheese and butter factories, and appointing a committee to look into the question during the year and report at the next convention, which will probably be held at Brockville a year hence.

The most important subject discussed was the report of the chief instructor, G. G. Publow, and the work of the syndicate instruction carried on during the past season. Twenty-two syndicates, representing 552 factories, with an instructor over each, had been operated. Each factory paid $15 towards the cost of the instructor, the Association or Government paying the balance. So great had been the demand for instruction that the Association had to go in debt to the tune of about $3,000 to meet it. This deficit will likely be made up by an increased government grant. The work is too important to be neglected because of the lack of funds.

During the season, 3317 visits were made by the instructors and 44,310 tests of milk made for adulteration and 10,693 fermentation tests for tainted milk. Out of the former only 359 adulterated samples were found while 9020 or over 90 per cent of tainted samples were found, thus showing the need of more attention being paid to securing a good flavored milk rather than to adulteration, which does not injure very materially the quality of the product.

There has been a great improvement in factory equipment brought about by the influence of the instructors. Over $43,000 had been expended by 230 factories in this direction. And better results are expected this year. A great deal needs to be done before the factories in Eastern Ontario reach anything like ideal conditions for cheese making. Mr. Publow estimates that not more than 25 per cent of the factories in operation fulfill anything like the conditions required.

There were few complaints during May and June about the milk or the quality of cheese, either. Early in July a bad, acidy flavor was reported from many of the factories. In fact this difficulty became so wide spread as to need special attention from the whole staff for several weeks. Not only was the trouble found in syndicate factories, but in the non-syndicate factories as well.

Samples of the infected cheese, milk, etc. were submitted to Dr. Connell, bacteriologist, Kingston, who also made a thorough investigation of some of the badly infected factories. He reported that the taint caused open, acidy or bitter cheese, at first showing small pin holes which afterwards developed into long slit-like openings, The trouble was not controlled by giving the curd more acid.

Dr. Connell traced the difficulty to yeast germs which grew readily in sour whey, forming a strong gas. He urged a thorough cleansing of all whey tanks, and the sterilizing of all milk cans used for carrying the whey home to the patrons. When this was done the difficulty was brought under control. In some instances this taint developed, where no whey was returned in the cans, but not to so large an extent.

In these cases it was traceable to milk that had been kept over night, under or near trees, the season, seemingly, being favorable for the growth of the yeast germs under these conditions.

Excepting this difficulty, which was very wide spread, during July and August, the cheese made during the season were more uniform and better in quality than ever before. The general defects were in flavor, texture and finish.

The whey tank came in for some consideration. The cement tank, when properly built, was recommended as being most suitable, though it was not so easy to elevate as the wooden one. The iron tank, made on the same principle as a boiler was recommended by Prof. Dean, though its costliness would be a factor against the average factory taking it up. Better milk cans were recommended. The general run of the milk cans used, do not last one season, due to the bad tin used. If patrons would pay a dollar or two more, they would get better value for their money.

The cooling of milk to at least 65 degrees immediately after milking, and stirring at the same time was recommended by all the authorities present. Aeration, as it has been practiced is not effective. Cooling the milk, and while this is being done, stir well, will give better results. The plan recommended was to place the can in a tank with iced water around it, and after the proper temperature had been reached, cover the can and place in a cool, clean place to keep, or leave it in the tank if the surroundings are favorable.

The preservation and transportation side of the business was dealt with by Mr. Ruddick. More attention must be given to preserving butter in a cool condition till it reaches the consumer. Many creameries do not pay enough attention to cooling butter before it is shipped.

At the cool-curing stations there had been a saving in shrinkage of 1.52 per cent in 1902, on cheese cured at about 55°, as compared with cheese at the ordinary curing-room temperature, and 1.23 per cent in 1903. This meant many dollars in the pockets of the patrons. Besides there was a great improvement in the quality of the product. Paraffining cheese had been found advantageous, though the old country dealer objected to it as he claimed cheese so treated shrunk more after they were cut up than cheese not paraffined. Mr. Ruddick showed that there was little ground for this claim.

Prof. Dean emphasized the need for makers making up their own cheese boxes. It would cost less and a better box could be secured. The material could be bought in a "knocked down" form and brought to the factory at much less cost for freight.

The butter making branch received scant attention. A well thought out address on the subject was given by Supt. Mitchell of the Kingston Dairy School on the last day. Aside from this the subject was rather side-tracked. This should not be. Though cheese is king in Eastern Ontario there is room for a good butter business also and the dairymen of that district would do well to have more than one string to their bow.

The officers for 1904, with one or two minor changes are tbe same as for last year. Mr. Derbyshire is again president.

Toronto, Canada. J. W. Wheaton.

Education and the Hired Man.

Ed. Hoard's Dairyman:—I notice in the Dairyman of Jan. 8, that John Gould has noted and commented that the introduction of the trolley, telephone and rural mail delivery has not solved the question of giving us farmers the laborers we need to do our work. To my mind this trolley-telephone-R. F. D. idea has always been a fool one, exploited by the city newspapers and little politicians in their endeavor to talk wisely on something they know nothing about. These organs are constantly telling us how prosperous we country people are, what a fine time we are having, what a lot of pure air we have to breathe and fine fresh water to drink; how a few cents per bushel on the price of our grain has made so many millions of rural wealth. One little politician in this state who is supposed to be in the line of agricultural education, a short time ago, puffed himself up and boasted that the cows of Pennsylvania made 140 lbs. of butter each a year and brought us farmers about 28 millions of dollars.

They tell us what a great privilege it is to hello over a phone to the banker to know if that note is due today or tomorrow, to call up the railroad agent and ask him what the exact time is, or "call down" some facetious neighbor who wants to know "How's crops?"

Just what interest the hired man may have in this telephonic performance I have failed to observe, and how we are going to keep the boys on the farm by allowing them to hello to their girls, with all the other girls along the wire listening, is outside my ken. Country boys have no kidney for telephone courting.

The trolley that carries you away to the town or city is not keeping anyone on the farm unless he can't raise the

price of a ride; and the circulars and the great dailies the R. F. D. man stuffs in the box have never brought content to a discontented home.

I am not decrying any of the good of any of these. They are great conveniences and add to the comfort of living. But I am discounting the arrogant idea the city puts forth, that people do not stay in the country because it is isolated from town—that is the country's one greatest charm for me; and while I would enjoy a few city things I cannot have in the country, I miss a hundred evil things of the city no well balanced country man would want.

FALSE EDUCATION.

We need not burn our school houses, for the depopulation of the rural districts is not due to education, but to the quality of it. We have never to my knowledge, educated in any direction except away from the farm. The country girls and boys have no thought drilled into them that is opposed to measuring success by any other standard than one of money. The man with a soul no bigger than a pressed autumn leaf in an old arithmetic is held up to them as the great and successful man if he has money and—great heavens! he may even be president of a bank or have stock in a trust!

Then these youngsters are imbued with the idea that they can get an education by attending a school or college a few years, and that with the commencement the process is finished. They are rarely, seriously told that one's education runs through life. Why, there are a hundred chances to become a farmer or a dairyman or a fruit grower, or a poultry man in six weeks, and I read the other day something about making farmers' institute lecturers by some instantaneous process. It is true that a great many of those being inflicted on the farmers now, should be made over somehow. Wonder if they could be born again?

THE WAGES.

Some man at the Missouri State Dairy Meeting said he had no trouble keeping hands by simply working on the old fashioned Golden Rule. Few men get rich on that rule, so it is very inoperative in these times of greed.

The farmer's sons and the men who would hire on the farms usually have nothing to depend upon but the selling of their labor, and they take it to the towns and cities and sell it to the trusts and combinations and infant industries we farmers have protected so jealously for so many years so they can pay two or three times the wages the farm can afford. The labor question is one of much wider ramification than the little scope of the trolley, the phone, the R. F. D. and the short course. The laborer only sees the work he has to sell and naturally takes it to the best market. He is not much interested in bulwarking the country home as the defense of the civic life of the nation. There is not much visible cash in that sort of thing and we must get money. F. W. MCSPARRAN.

Penn.

Notes from New York.

ED. HOARD'S DAIRYMAN:—At Rouse's Point in Northern New York, while waiting for a train, I sauntered out to find a dairy farmer, for it is seldom that one talks long with a progressive dairyman without learning something. I found my man, and before leaving him he volunteered the information that all he knew about correct feeding he had learned from reading HOARD'S DAIRYMAN.

Mr. Fairbanks has a fine farm. It is level land or slightly rolling, lying within the plains about Lake Champlain—a limestone soil, where clover grows quite naturally, and which is good grain and grass land. Although the climate is perhaps a little cool, I judge that here is a very good section for dairying. Comparatively few dairies are kept, however, and the sale of hay and grain are depended upon quite largely for money crops. Mr. Fairbanks believes in the dairy and in dairying, as the best means of bringing back the soil to its original fertile condition.

This is a region for which nature has done much. Level land, easily worked, a good soil which is furnished bountifully with the elements of fertility, including a good supply of humus, are conditions that a good farmer appreciates.

From my observations, I judge that the average farmer has not dealt so generously with his land as the Lord did. The farmer has taken off crops for many years for which he has secured cash returns, and has apparently paid but little back to the land. Occasionally a farmer, like the one mentioned in this article, sees the need and is applying the remedy, and the result is profit to himself.

Land is held at a good price, the best, under favorable circumstances being considered worth $50 to $60 per acre. There are instances here as elsewhere, that a sum considerably below the highest figure would take the land. Hired help is as scarce as in other sections, and some who want to be relieved of the burden, would be tempted by a moderate offer.

***

At a farmers' institute held at Afton, N. Y., under the appointment of F. E. Dawley, Mr. Van Wagenen discussed the "Evolution of the Dairy Cow." He traced the history of the cow from her wild state to her present condition. He showed how different conditions of soil and climate have, in different localities, produced such widely different types. In a cold climate a long-haired animal is found; in places where wild animals threaten, a small, swift runner develops; where there is scanty vegetation. a small animal, capable of subsisting on less food, is the one that survives.

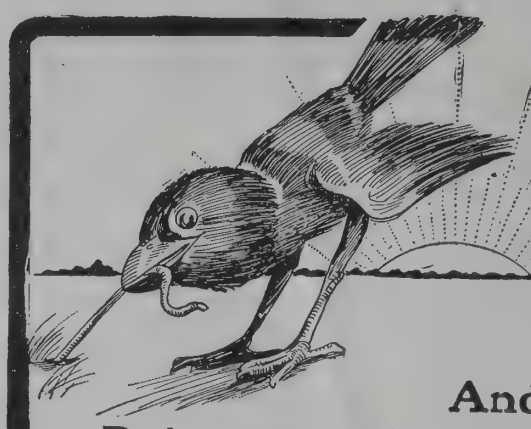
Then he traced man's influence, showing how, by selection, he breeds animals true to one peculiar marking or another, such as the belted cattle, the fawn colored, or black animal with a white head; or, a class of animals that lay on great depths of flesh along the spinal column, where flesh sells at the highest price, and another that puts fat on the ribs. There is another that instead of fat and flesh on the body, puts the fat into milk with the result of producing an enormous quantity. Mr. Van Wagenen insists that you cannot put all of these qualities into one animal, nor any two of them to good advantage. Select the quality for which you wish to work and make the most of it. H. H. LYON.

New York.

Cows Compared.

Something over 18 months ago we built a co-operative creamery here. Nearly all the patrons had dual-purpose cows, and for the benefit of those interested in dairying I will give the figures from our creamery books showing how the milk yield, butter test and cost returns stand for the 10 months ending with October, 1903.

First, I give the returns from 3 strictly dairy bred cows, one 2 years, one 3 years and one 9 years old. Butter test averaged a little over 5.1 per cent. Milk yield, 9,546 lbs.; cash received, $104.06; average per cow, $34.68.



Second. Dual-purpose cows, 7 of them and the record is for six months: Butter test, 3.7%; milk yield, 13,839 lbs.: cash returns, $104.96; average per cow, $14.99. This report is for May, June, July, August, September and October.

Third. Dual-purpose cows, 9 of them for 10 months. Average test, 3.8; milk yield, 22,329 lbs.; cash returns, $185.44; about $20.60 per cow.

Fourth. Dual-purpose cows, 8 of them for 10 months: Average test, 3.7; milk yield, 19,849 lbs.; cash returns, $156.56, or $19.57 per cow.

The returns for the 3 dairy bred cows for the 6 months reported in the second case was as follows: Test, 5 per cent; milk yield, 7,267 lbs.; cash returns, $75.14; average per cow for the 6 months, $24.04.

None of herds included in this report were given the care and treatment they should have had, and experience made it apparent that we must breed better, feed better, and provide more pastures for our cows before we can get returns that will prove highly profitable. Too many poor dairy cows, on too poor pastures and given improper care, will keep the balance on the wrong side of the ledger.—E. V. N. in *Farm, Stock and Home.*

"It's the Early Bird that Catches the Worm."

And it's the Dairyman who is first in the field with The U. S. Cream Separator that catches the increased profits.

Truth to Tell

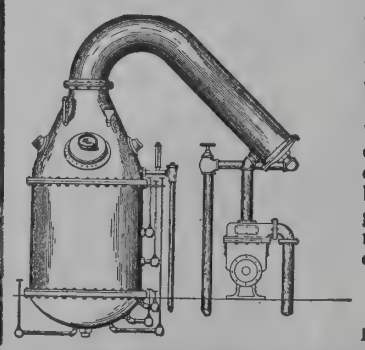
There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned. Remember, the Buhl is the only can in the world that is made with the Buhl "Victor" Can Breast and the Buhl "Victor" Round Handle. As there are many inferior imitations of this can, we stamp all ours with the Milk Can Trade Mark. Look for it. Sold by all live dealers. Ask about them, or write us direct.

BUHL STAMPING COMPANY,
212 W. Larned St., Detroit, Michigan.

A Wagon's Worth



depends upon its convenience and life. The life depends upon the wheel. You get every convenience of the **Modern Low Handy Wagon** and double its life by using

ELECTRIC Metal Wheels

For a few dollars you turn your old running gears or one you can buy for a song, into a new wagon. Straight or staggered oval steel spokes. The stoutest wheel you can buy. **Any height, fit any wagon.** No repairs, no rutting, light draft, long service. Let us send you free catalog to show you how it saves you money.

Electric Wheel Company., Box 130 Quincy, Illinois.

Milk Condensing Machine

I supply the most improved machinery and most successful processes for manufacturing all classes of condensed milk and evaporated cream. Factories built complete, put in operation and results guaranteed. If you are interested write for my new illustrated and descriptive catalogue. The only catalogue ever published on the subject.

Report of the Vermont Dairymen's Convention.

[Continued from page 1142.]

WEDNESDAY FORENOON.

ED. HOARD'S DAIRYMAN:—This was the great day of the convention. There was an excellent program well carried out. The hall was filled with attentive and appreciative listeners.

The first speaker was M. A. Adams, of Derby, the manager of a co-operative creamery, and his subject was the "Organizing and Maintaining of a Successful Co-operative Creamery." He appeared to be highly in favor of this method of buttermaking, believing that farmers get good returns from it. But to be the most successful it must be well managed, from beginning to finish. There must be hearty co-operation among those interested, all working together for the general good.

The conditions must be of the best and all things faithfully and ably carried out. There should be suitable buildings, well equipped with all necessary appliances, a competent buttermaker and manager. As the buttermaker usually has enough to do with his work, the office of manager should be separate, and as much of success depends on how the affairs are conducted, a man of ability should occupy this position.

The last speaker of the forenoon was Ex-Gov. Hoard. He has been before a Vermont audience so many times that there was scarcely a necessity for an introduction. He is always sure of a hearty welcome from the dairymen of the state, and finds no difficulty in making himself at home with them, and always appears to be in his element whenever he can give them a word of help and cheer.

He occupied the remaining hour of the session with a most interesting talk on various topics, as no particular subject had been assigned him at this time, and he did not need any.

He referred with much modest pride to the condition of agricultural affairs in his home county, and well he might, for it is such as should or might well commend itself to any part of the country.

He dwelt upon the importance of the better education of farmers in that which pertained to their occupation. He considered it a fact that many farmers were not as good dairymen as they were before the advent of creameries, and that this should be remedied in some measure by making the creamery an institution of education, where farmers could learn the more recent and best ideas in regard to dairying.

Farmers should keep well informed in relation to their business by more study and observation, using their brains as well as their hands in their occupation. "The farmer should be bigger than his farm." True!

He spoke of the superiority of German over American farmers, which was due to the fact that they were taught by their government how to farm. He deplored the fact that in by far too large a part of this country, the soil is deteriorating in its productive capacity and consequent value. He thought this should not be, and strongly advised the raising of more clover as a renovator of the soil, and the producer of a larger amount of forage. This able and timely address completed the exercises of the forenoon, and the farmers went their way to further consider the matters brought to their attention during the session.

After a good dinner the audience came together at 2 o'clock to enjoy a session devoted to an experience meeting; the exercises being in the form of ten-minute talks interspersed with discussions.

The President first called on J. Moldenhawer, from Canton, Ohio, who spoke briefly on the "City Milk Supply." He spoke of the importance and value of pasteurizing milk and cream for the markets. This helps to improve the quality of these products in several ways, and he thought was destined to be brought quite generally into use. In Denmark there is a law compelling the pasteurizing of milk for calves and pigs to prevent the spread of tuberculosis, and at the West the practice has already commenced and other parts of the country must follow, if they are to keep up with new methods of improvement. The pasteurized product is considered to be more healthful and of a uniform quality.

Henry VanDresser, of Cobbleskill, New York, a most successful poultry raiser, followed with an interesting and instructive talk on poultry raising as an adjunct to the dairy. He spoke of the importance of securing the best breeds for eggs for the table, and of caring for them in the best manner. Not much of success can be expected without attention to the details of the business, but with this it can be made very profitable. Dairying and the keeping of poultry go well together, and on the smaller farms should be more generally followed. The gentleman spoke very earnestly and enthusiastically upon this subject, and was listened to with interest and attention.

Next in order was Hon. H. C. Adams, M. C., of Madison, Wis., and his subject, "Co-operation of Butter Makers."

As there is so much of co-operation in other occupations and in the commercial business of the country, he thought it of importance that butter makers should fall into line. These men need to get together and talk over their affairs and make a pool of ideas. Each butter maker should know all that the others know in order that they may become the most proficient in their business—indeed, so proficient that oleomargarine may be swept from the country. This gentleman was listened to with much attention, and hereafter Vermont farmers will have an increased regard for a certain product of the noble state of Wisconsin, its able men that somehow find their way even to the little Green Mountain state.

Next on the program came a genuine Vermonter, C. F. Smith of Morrisville. His subject was "Forage Crops for Use When Pastures are Dry."

Mr. Smith is a large grower of clover and so of course he recommends that, and corn, but all things considered he gave the preference to the summer silo for use when the pasture grasses begin to fail. This is ahead of anything he has yet tried. He gave quite an interesting account of how he utilized last season a huge growth of weeds, that took possession of a field during the wet, unfavorable season, by putting them into the silo. There was a heavy crop and he had been feeding this kind of silage for several weeks with very good results.

He would not recommend this crop for forage, but as a last resort he thought it was quite a success, as it was much better than no crop at all.

President Aitken gave a short talk on the "Breeding of Stock," a subject which he is well qualified for treating. He thought there should be more competition among cattle breeders with a view of the greatest improvement. We should endeavor in all ways to keep the standard of improvement and excellence well up, ever making progress ahead.

Ex-Gov. Hoard followed with an interesting talk in which he suggested the idea

(Continued on page 1164)

"ADVERTISEMENT."

DR. FED HIMSELF

Found the Food that Saved His Life

A good old family physician with a life time experience in saving people finally found himself sick unto death.

Medicines failed and— but let him tell his own story. "For the first time in my life of 61 years I am impelled to publicly testify to the value of a largely advertised article and I certainly would not pen these lines except that, what seems to me a direct act of Providence, saved my life and I am impressed that it is a bounden duty to make it known.

"For three years I kept failing with stomach and liver disorders until I was reduced 70 lbs. from my normal weight. When I got too low to treat myself, three of my associate physicians advised me to 'put my house in order' for I would be quickly going the way of all mankind. Just about that time I was put on a diet of Grape-Nuts predigested food. Curiously enough it quickly began to build me up, appetite returned and in fifteen days I gained 6 lbs. That started my return to health and really saved my life.

"A physician is naturally prejudiced against writing such a letter but in this case I am willing to declare it from the housetops that thé multiplied thousands who are now suffering as I did can find relief and health as easily and promptly by Grape-Nuts. If they only knew what to do. Sincerely and Fraternally yours." Name of this prominent physician furnished by Postum Co., Battle Creek, Mich.

Look in each package for a copy of the famous little book, "The Road to Wellville."

It Costs But Little

to buy and you are enabled to try at your home and know that the one Cream Separator that satisfies is the

THE
IOWA DAIRY SEPARATOR

An up-to-date machine replete with practical ideas.

It is built in the following sizes: 250, 350, 450, 600, 750 pounds per hour.

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

Send for Catalogue No. 60 and printed matter.

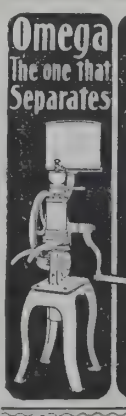
IOWA DAIRY SEPARATOR COMPANY
WATERLOO, IOWA.

MORE BUTTER From the MILK

Every owner of 10 or more cows can get more butter from his herd by using a No. 6

NATIONAL Cream Separator

It's a big saver in the dairy. Separates about one gallon a minute, or 450 lbs. in an hour. A light running machine—does quick and close work under all conditions.



The price of the No. 6 National is $100. You take no risk in ordering, as the machine has stood the tests of Experiment Stations, and the severer trial of constant use in private dairies. Hundreds of practical dairymen have proved that the National way makes the dairy pay.

Send for free pamphlet No. 30. It will save you money and increase your profits. Write *now*.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

AS IT IS IN INDIANA.

C. P. Goodrich took a cow census at Plymouth, Ind., a few weeks since of 50 farmers patrons of a creamery. Note the following facts: The total number of cows was 250: the average cost of keeping per cow was $24.96; the average returns in butter fat per cow was $32.20; the average number of pounds of butter fat per cow was only 166; the average net price was 19.4 cents: the average net profit per cow above cost of feed was $7.24; the average returns for $1 worth of fead was $1.29. The six patrons who read a dairy paper averaged $21 per cow over and above the cost of feed, while the 44 who did not read a dairy paper received only $5.58 per cow above the cost of feed. Does it pay to go without sound dairy reading?

COMING EVENTS.

Massachusetts Creamery Association, Greenfield.

Wisconsin Buttermakers' Meeting, Eau Claire, Feb. 2-4, 1904.

Wisconsin Dairymen's Convention at Platteville, Feb. 10–12, 1904.

THE DAIRY SIDE OF IT.

An inquirer asked Prof. Shaw of the St. Paul *Farmer* "what breed of a bull would you advise me to use on my scrub cows to get good milkers in Minnesota?"

True to his beefy, dual-purpose tendencies, the Professor advises him to use a Red-Poll, Short-horn or Brown Swiss bull, thus ignoring all that the world has accomplished in the past five hundred years in the way of developing cattle of specific dairy capacity. Mr. W. F. Schilling, editor of the Northfield, Minn. *News*, made a column of very pertinent comment on such unscientific as well as ill-judged advice. One paragraph of Mr. Schilling's article shows up the inconsistency of this dual-purpose advice. It is as follows:

"Suppose this same farmer should have asked the question: "What breed should I select if I wish to raise beef cattle?" Professor Shaw would have answered him by saying Short-horns or some other beef breed. People are very likely to get mixed in this kind of information and there should be a line drawn somewhere. The breeding of a herd should not be guess work. If a person is breeding for all beef or all milk, he certainly finds many difficulties, but when he is breeding for milk and beef together, he is up against the real thing."

Great is dual-purpose.

KEEPING TAB ON THE COWS.

Many of our readers will remember the interesting articles contributed last spring to these columns by Mr. A. J. Glover B. A., who has been making an investigation of various herds of cows in Illinois under the direction of the College of Agriculture of that state. Mr. Glover gave our readers many of the results of these investigation which were made on the same lines as the cow census reports we have repeatedly given. His work has been condensed in a bulletin. One of his deductions will fit right in here very well. He says:

"Some of the herds returned their owners a good profit, others a small profit, and one herd was kept at a loss. Six out of the eight herds contained cows that did not pay for the feed they consumed.

"In estimating the profit or loss on a cow, it was estimated that a calf paid for her keep while dry and that the skim milk paid for labor. The cow that yielded the largest product gave 8,949 pounds of milk, and made 472 pounds of butter. The poorest cow produced 1,482 pounds of milk, 68 pounds of butter; and the average production for all the herds, except Gurler's (D) was 4,721 pounds of milk, 3.67 per cent fat, 173 pounds of butter fat, and 202 pounds of butter. The most profitable cow gave a net profit of $57.22 and the poorest cow was kept at an actual loss of $17.83; the average net profit was $9.40 per cow.

These facts and figures do not need much comment from us. We will simply say that the profitable cows were found in the hands of men who give thought and study to the business, the unprofitable ones were owned by men who don't believe it pays for a farmer to make an effort to be a well posted, intelligent man. That is the situation all over the land. Wherever we have taken a "Cow Census" it has been the same; poor cows, poor returns, and ignorance have gone together. How some men do love to work for nothing and board themselves.

NOTES ON ALFALFA.

F. E. Dawley, of Fayetteville, N. Y., who is at the head of the Bureau of Farm Institutes of that state, has made a pronounced success in growing alfalfa, as also have a large number of other farmers in that portion of New York. In a letter to us under date of Oct. 8, Mr. Dawley says:

"There is no doubt at all in my mind but it (alfalfa and corn ensilage) is the ideal economical ration for dairy cows. We are getting our feed bills down next to nothing and find that with the use of just a small quantity of distillers grain with a little oil meal, we can get fully as much milk as we used to get with the high grain rations which we fed, and milk too, which tests high in butter fats. It is an actual fact that hundreds of farmers in this section of Onondaga county are getting rich making milk for the creamery here."

It was in this portion of Onondaga county that Mr. Jenkins took a cow census for HOARD'S DAIRYMAN of 80 creamery patrons, one-half of whom fed alfalfa and the other half did not. It will be remembered that the net profit of the alfalfa feeders per cow, was nearly eleven dollars greater.

W. S. Downs, of Derby, Conn., writes concerning his experience with alfalfa which has not been very satisfactory. He took an acre of river bottom, ten to twelve feet above water and gave it a dressing of eight barrels ot slacked lime and sowed 30 lbs. of seed on it. A forty days drouth came immediately after sowing. When the rains came it started and so did the weeds. He cut it three times during the summer and now he has from a quarter to a third of a stand. Some of the roots made a foot or more of growth. He asks: "What shall I do with it next spring? Shall I scratch it over with a weeder and sow on some more seed or plow it all and re-seed? I can give it 25 or 30 bushels of wood ashes." He states that he finds the nitrogen tubercles starting on the roots of the young plants. This is evidence sufficient in our mind that he does not need to inoculate the soil with soil from other alfalfa fields.

Answering his questions, we would say that it is a little difficult for us to advise as to whether he should retain the old seeding or plow up and re-seed. If he allows the seeding to stand, it will continue to improve and increase for three years. If he plows it up and re-seed, it may prove much the best thing to do. We rather incline to the latter course. The wood ashes are a splendid thing for this plant. Seeding with alfalfa in this latitude should always be done in early spring so as to give the plants a chance to make all the root growth before winter that they possibly can. We believe his repeated cutting did the plants great harm.

Advices from Colorado state that the price of first-class seed has gone up nearly five cents a pound above the price a year ago. The dealers in Greeley, Colo., are asking 16½ cents a pound. Several thousand pounds of German seed has been imported into Colorado in the past few months.

Whenever it is practicable, we would advise growers to use northern grown seed as much as possible. We hope none of our readers will fail to make a trial of this splendid forage plant, because of the high price of the seed.

Every farmer should select a good, fertile, well drained piece of ground, not less than an acre or two, fit it carefully and sow not less than 25 pounds of seed. It is a most excellent thing to dress the land just before sowing with 30 to 50 bushels of wood ashes, or 300 lbs. of muriate of potash. Let every one give it a trial; if they fail, try again.

A CONTRAST.

The great, central purpose of all farming should be to preserve and increase the fertility of the soil. If, in the practice of an individual or community, this purpose is lacking, then we have a right to indict such practice and say it is not true farming, but soil robbing. We believe it fair to say that no man can call himself a farmer in the true sense of the word, unless his practice results in a constant increase of the productive power of his farm. In that very interesting address, "The Influence of the Monks in Agriculture," by Dr. Henry Goodell, President of the Massachusetts Agricultural College, a very instructive account is given of the wonderful results wrought by the Catholic Monks of England in the early centuries, in improving the soil. He says:

"The half at least of broad Northumberland, covering an area of about two thousand square miles, was lost in sandy plains and barren heaths; the half at least of East Anglia and a considerable part of Mercia were covered with marshes difficult of access. Yet in both these regions the monks substituted for these uninhabitable deserts, fat pasturage and abundant harvests. The latter district, the present name of which (the Fens) alone recalls the marshy and unwholesome nature of the soil, became the principal theater of the triumphs of agricultural industry, performed by monks. Medehampstead (now Peterborough), Ely, Crayland, Thorney (now Southampton), Ramsay were the first battle-fields of these conquerors of nature, these monks who made themselves plowmen, breeders and keepers of stock, and were the true fathers of English agriculture, which, thanks to their traditions and example, has become the first agriculture in the world."

That is a noble and impressive picture. It satisfies the heart and brain in the measure of what constitutes true farming. These toiling monks were "conquerors of nature," not robbers of nature. Nay, more than that, they took poor, infertile soil and made it fertile, to the blessing of all subsequent generations. And these monks lived in what are called the "dark ages."

Contrast this impressive picture with the effect of the march of the American bred farmer across the western continent, from the Atlantic ocean toward the Pacific. He has made this march in the full blaze of all the knowledge of these last centuries. He has been greeted with a soil wonderfully endowed with native fertility.

Yet every step of his way has been marked with a destruction of fertility. From the New England States, through New York, Ohio, Indiana to the rich prairies of Illinois, his progress has been one of soil robbing and final decline in the values of farm lands. Why is this thus?

We believe it is because the American farmer has refused to make an earnest soil student of himself. He has been of a different order of mind from the old monks. They gladly hailed knowledge and every aid that study and thought could bring them. The American farmer for years has contemned the idea of making a scientific study of farming. His constant sneer against so called "book farming" was only another plea that it is better to remain in ignorance. And so the land has suffered at his hands. The monks had no books, but they were profound students; they farmed with their minds. They constantly thought and wrote and talked on agriculture. They guarded well the fertility of their lands and held up the doctrine that it is the bounden duty of the farmer to so farm as to increase it.

Mark the difference that has been wrought in the destinies of a country by these two systems of proceedure. One was the product of thought; the other is the effect of despising thought, and living for to-day only. The American farmer has said in effect: "What care I for preserving fertility. When this farm is worn out I'll go west and wear out an other farm." And he has so educated himself and his sons.

But, thank Heaven, a change has set in and he is coming to see the use and value to himself and his calling of study, of schools, of books and papers and all that shall aid in enlightening the mind.

A VERY PREGNANT QUESTION.

HOARD'S DAIRYMAN has always opposed the idea of dairy farmers putting themselves to the expense of doing dairy work on the farm with the dual-purpose cow. We have opposed the dual cow because of two things: (1) She is not a profitable kind of cow to do dairy business with as compared with the special-purpose cow. (2) Let a farmer once get the dual-purpose idea in his head and that is the end to all progress in the way of breeding for any improvement in the dairy quality of his cattle.

The very trenchant and suggestive communication found on page 1173 of this issue, under the head of "Agricultural Education in Iowa," should be read and pondered long by every one who is capable of tracing results to their cause. We esteem the Agricultural press of Iowa and the teachers in her splendid agricultural college very highly. But what has been and what will be the effect of their constant teaching of this "dual-purpose idea" on the dairy industry of Iowa? Men in high places are justly held responsible for the tendencies of their teachings, whether they like or not. The dairy industry of Iowa is languishing, because of the great economic fact that the cows that the Iowa farmers have been taught to breed, are not profitable milk producers. Beef has taken a slump, and the more meat this dual-purpose cow produces the worse off is her owner.

What the Iowa farmers and creameries want, to make them prosperous, is lots of milk from cows that will yield milk prof-

itably, even at prices for butter much below the present.

The only kind of cows that will do this, as a rule, are the cows that are bred especially for milk giving. Even at that, there will be fully enough poor ones to bring down the profits all we can bear. But what is to be the condition of the farmer who goes to the expense of stabling, feeding and caring for cows, as well as the expense of transporting their milk to the creamery, to find that he has a class of cows unfit for the business?

And what answer will the men make who have taught him, and encouraged him to buy beefy bulls to breed such cows from? It is always a dangerous thing to juggle with fixed principles. It may be quite convenient at times to say that twice two are three or five, but when we come out at the end of the column, we find our punishment for such trifling.

If the Iowa farmers expect to continue in the business of dairying, they must revise their ideas of the dairy cow. They must get rid of the notion that beef and milk can be bred, with any profitable certainty, into the same animal, for she will "mock when their fear cometh."

The DAIRYMAN has stood firmly by what it believed to be the fixed principle of animal function and breeding. Possibly it might have had a few more subscribers in Iowa and some other of the beef states, if it had gone in for the "dual-purpose idea." But that would have been a clear case of misleading. Nothing makes such close joints as the truth, and this is especially true in the art of successful dairy farming.

MISTAKES IN A BARN PLAN.

Mr. Thomas Barr, of Kewaunee county, Wisconsin, intends to build a barn in the spring. He sends us a plan of the basement stable, and writes as follows: "If there are mistakes in the plan, please mention them in your paper."

The plan shows a proposed structure 110 feet long by 46 feet wide, with ends to the east and west. The basement is to be stone walls, 2 feet in thickness, with five windows, each 4 feet long by 2½ feet high, on the south side, 2 on the east end, and some (number yet uncertain) on the north and west. Ventilation has not been forgotten, for some advice in that respect is requested.

Commencing at the northwest corner, the plan shows a silo 12×14 feet inside, then a vacant space of 14 feet, and then a row of nine box stalls, each 8×11½ feet. In front of these box stalls is a feeding alley, 5 feet wide, then a 5½ feet platform, 90 feet long, for cows, with a 3 feet passage or walk between it and the east end of stable. Next to this platform is a space 10 feet wide for gutters and driveway, with double doors at either end. In the southeast corner it is proposed to partition off a milk room 8×10 feet, and west of this, along the south side is a vacant space, 10 feet wide and 66 feet long, intended possibly for young stock. There is then left 30 feet in length by 10 feet in width in the southwest corner which is divided into 6 horse stalls.

In our judgment, it is a serious mistake to build a barn 46 feet wide. It cannot be arranged so as to be convenient, or to utilize all the space to good advantage. We consider 38 feet the extreme limit for width, after allowing four feet for the walls. This would give 34 feet in the clear, unless we allow three inches on either side for lining the walls with boards, which is something that ought to be done to promote warmth and comfort for stock. We would then apportion this space as follows: 4 feet on either side for feeding alleys, 2 feet for mangers, 5 feet for standing platforms for cows, 1½ feet for gutters, and 8½ feet for central driveway.

If we were planning a stable for 30 cows, and the usual complement of young stock, we would expect it to be from 80 to 90 feet long, but only 45 to 50 feet spaced as above for cows, the balance being required for box stalls, young stock, feed bins, stairway, etc., and would attach a wing or ell, at the southwest corner for horses. We would locate the silo outside the stable, and preferably on the north side, and would have it not less than 16 feet square on the inside, without cut off corners. The bottom of the silo may be 4 feet below the level of the feeding floor of the stable.

The second important mistake in this plan is the limited number of windows. Windows should not be more than 6 feet apart, and if these intervals were reduced to 3 feet, it would be still better.

In order to secure proper ventilation, build one large flue, at least three feet square on the inside, outside and in the angle where the wing or ell for horses joins the main barn. This may be built of brick, like a chimney, or of lumber, if made practically wind proof, and should extend a little higher than the ridge of the barn. Make a full sized opening at the bottom to draw off the cold and foul air in winter, and another at the top of the stable to let the heated air of summer escape, with doors or slides, so that either opening can be closed at will.

For the admission of fresh air, there must be several small flues, built in the walls. These flues must open inwardly just below the ceiling, or floor above the stable, and outwardly from three to six feet lower down. Constructed in this way, the warm air of the stable will not escape through these flues, but fresh air from the outside will come in, mingle with the warm air at the top and gradually fall down to where the cows stand, to take the place of the cold and foul air, which is drawn off by the large flue.

GLEANINGS OF DAIRY WISDOM.

CLEAN MILK AT THE CREAMERY.

Some improvement in the grade of milk delivered at the creamery has been made during the last ten or fifteen years, as a result of the diffusion of information as to the relationship between dirt and dollars. PROF. J. L. HILLS.

Vermont Experiment Station.

That is a pithy way of putting the question: the relation between dirt and dollars. A farmer brings in dirty milk and does not know that such milk knocks him and his brother patrons out of dollars, and the rest of the patrons do not realize their own loss sufficiently to rise up and demand of the buttermaker that he forbid the taking in of such milk. They are being robbed by the dirty carelessness of other patrons and swallow it all without a wink. That is the situation at hundreds of creameries. Payment by the Babcock test is not enough says Prof. Hills. There ought to be a payment by the dirt test.

BREEDING DAIRY COWS.

"It easier for water to flow down than be forced up. It is easier to breed down, than up. The grade bull is a curse to the dairy interest. You do not know whether his stock will take back to the Jersey or Holstein, or to the common scrub, from which he sprung. The sire is half of the reproducing power of the herd, and has the power to improve or injure to that extent, everything else being equal." F. C. BRONSON.

In the above short statement, Mr. Bronson shows why so many farmers breed down their herds instead of breeding them up. It is for the same reason water runs down hill—it is easier. It is cheaper and easier to buy a grade bull than a registered one. Last summer a dairy farmer near this city showed us a badly shaped grade bull, which he said he was going to use on his herd. He was not after good cows as was evident, by the character of the bull. A Jew asked a railroad ticket agent for a ticket to Springfield. "Springfield, Ohio; or Springfield, Massachusetts?" said the agent. "Vich is der sheepest?" replied the Jew. Cheapness is the principle reason that governs in the purchase of bulls with very many farmers. It is a question of sowing seed. Does it pay to plant poor seed?

STRONG WOMEN VS. STRONG BUTTER.

They tell a story in Vermont about a certain women who was so strong that she used to give her husband a good trouncing occasionally. One day their little boy being questioned by a neighbor, said: "Oh yes, mother is stronger than father; she can take him down and keep him down. But she bought some butter at old Thompson's the other day, that was stronger than she was; she could take it down, but she couldn't keep it down."

WARMTH IN THE STABLE.

"Who has been able to ascertain correctly the proper temperature for dairy cows? High temperatures are milk producing in spring and summer—that is 70°. In the winter we have come to think 50° is high. While I do not absolutely know, I feel confident from experience, that the highest temperature obtainable—*carrying with it pure air*, will be a safe working rule, which in our stable is 54° to 60°.

H. E. COOK.

THE CREAMERY AN EDUCATIONAL CENTER.

There are several movements that ought to radiate from the creameries; co-operative breeding associations with the purpose of buying pure-bred bulls for service on the best cows; co-operative egg-collecting associations where eggs are paid for according to quality and put in cold storage at once; co-operative ice houses and possibly co-operative laundries.

Now as to your own mind improvement, I strongly urge you to read at least two good dairy papers and one good agricultural paper, as well as the standard works on dairying. J. H. MONRAD.

The last paragraph of the above excellent advice reminds us of a letter we received a few months since from a Maine farmer. He said that he had struggled along for 20 years without any improvement in his fortune, but within three years after he commenced to feed his own mind with good dairy reading, his cows went up from 3,200 lbs. of milk annually to nearly 5,000 lbs. "I tell you," he said, "there is a money value to it."

THE KIND OF DAIRY COWS WANTED.

"It is the herd of special-purpose dairy cows we want and not the herd kept to furnish chores for the owner or hired man * * * Dairy type is not an accident; it is not something that just happened. There are good reasons for every point of make up. It is advisable that every one engaged in dairying should procure a pure blooded sire.

M. L. THOMAS.

Annual Meeting of the Eastern Guernsey Breeders' Association.

ED. HOARD'S DAIRYMAN:—The annnal meeting of the Eastern Guernsey Breeders' Association was held at the Continental Hotel, Philadelphia, on January 7th, 1904.

First vice-president, E. T. Gill, occupied the chair and called the meeting to order. The secretary being absent, S. I. Murphy acted. Eighteen members responded to the roll call. The following names were proposed for membership: A. C. Gardiner, Mullica Hill, N. J.; Roy L. Smith, Wawa, Pa.; Francis Edward Bond, Penllyn, Pa.; Fred Barclay, Haverford, Pa.

All the names proposed at the previous meeting were approved by the membership committee and were elected.

The new officers for the year 1904 were then chosen, the result being as follows: President, Hon. E. T. Gill, Haddenfield, N. J.; 1st Vice Pres., Geo. Wood, Philadelphia, Pa.; 2nd. Vice Pres., Edward T. Price, Broad Axe, Pa.; Secretary and Treasurer, M. M. Hollingsworth, Landenburg, Pa.; Executive Committee, J. L. McCormick, Bel Air, Md., S. I. Murphy, Woodbine, Pa., Ezra Michener Michener, Pa.; Committee on Membership, John Tyler, Salem, N. J., Dr. C. M. Settyer, Philadelphia, Pa; E. J. Hollingsworth, Landenburg, Pa.

Under new business, the question of changing the Constitution, limiting the number of members to fifty was considered, and after some discussion a resolution to that effect was adopted by the meeting.

The By-Laws were amended, so that a member ceasing to be an owner or a breeder of Guernseys, or ceasing to have the charge or management of a Guernsey herd, or who absents himself from three consecutive meetings without a reasonable explanation, shall forfeit his membership in the Association.

Dr. E. B. Voorhees, Director of the New Jersey Experiment Station read a highly interesting and carefully prepared paper on "What the Guernseys have Demonstrated in Public and Official Tests." At the request of the members, Dr. Voorhees consented to allow the paper to be published in pamphlet form after he has had time to add to it such data as will bring it up-to-date.

Lunch was served in a private dining room of the Continental, after which the meeting adjourned.

M. M. HOLLINGSWORTH, Sec.
Landenburg, Pa.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Oil Meal or Ground Flax Seed.

Would you advise feeding, say 10 per cent of ground flax seed for dairy cows? M. E. R.
Muncy. Pa.

See answer to a similar inquiry on page 1135.

A Minnesota Ration.

Will you please form a ration from the following: I have corn ensilage with considerable corn in it, good clover hay except little overripe, corn worth 35 cents, can grind corn and cob myself; oats, 30 cents; bran, $14; oil meal, $25.

I am now feeding ensilage morning and night about 40 to 50 lbs. to each cow, according to the milk she gives, and what hay they will eat, and 1 lb. of bran for each 3 lbs. of milk the cow gives. Some cows were fresh in September, and give only about 16 to 18 lbs. of milk a day. One was fresh two months ago, and has given about 34 lbs. a day. What effect has it on a cow to try and milk a little before she comes in. I have one that the children had stripped a little on the two right teats, and when she came in she gave more milk on those than the other teats.

Stewartville, Minn. SUBSCRIBER.

We do not see how the present style of feeding can be improved upon, as bran at $14 is cheaper than oats at $18.75, and there is undoubtedly as much corn in the silage as can be profitably fed. The only point that occurs to us that may possibly have been overlooked, is the item of salt. It is too much the habit of the dairymen to give salt not oftener than twice a week, whereas it should be given daily at least, or better twice a day. Salt aids digestion and assimilation, besides being an appetizer and stimulant to more liberal drinking.

It is quite possible that the gentle massage of teats and udder may have induced an increased flow of blood to those parts, and as milk is made, more or less directly, from the blood, the quarters so handled might be relatively increased in yield.

A Missouri Ration.

I have Jersey cows weighing about 900 lbs. I have clover and timothy hay, corn at 45 cents; bran, $14, oats, 35 cents, How would you divide this to make a profitable return from cows?

I have a 1-year-old bull calf (Jersey) from a choice cow. Would you recommend keeping him and breeding his half sisters to him?

Out of 2000 lbs. of milk I get $25 in butter at 20 cents a lb; is this poor results or not? My fresh cows give 25 to 30 lbs per day; long strippers less, as low as 10 lbs.

I read HOARD'S DAIRYMAN one night out of every week. My wife is thinking of trying to get a damage suit against HOARD'S DAIRYMAN for crazying me so about reading it. I tell her to keep still as I get so much good information from it. F. M. W.

Fair Grove, Mo.

When one receives $25 for the butter, at 20 cents per pound, made from 2000 lbs. of milk, the average fat content of that milk cannot be less than 5 per cent. Cows giving 25 to 30 lbs. of such milk, and averaging 900 lbs., are entitled to very generous feed. If limited to the feeds named we should select bran and corn, because at the prices named they are relatively much cheaper than oats, but we would make a strenuous effort to get enough linesed oil meal to give each cow at least one pound a day. Otherwise feed daily 6 lbs. bran, 4 lbs. ground corn and as much hay, if of good quality, as each cow will eat without leaving any in her manger. If the oil meal can be had, drop out an equal weight of corn. For cows giving only 10 lbs. of milk, feed hay as above and 3 lbs. bran and no corn meal.

In the matter of bulls our advice is to get the best, without much regard as to cost or consanguinity. There is no greater mistake than an attempt to use an inferior bull rather than invest $50 or more for a better one.

A Michigan Ration.

Please give balanced ration for cows, fresh last fall, weighing about 900 to 1,000 lbs. We have the followiug feed: cotton seed meal, ensilage, clover hay, shredded corn fodder, bran (wheat), worth $20 a ton, buckwheat bran worth $12, corn and oats $22, cotton seed meal worth $24.
Dundee, Mich. J. H.

With an average daily allowance of 30 lbs. silage, 6 lbs. each clover hay and shredded corn stover, 6 lbs. corn and oats, and 1 to 2 lbs. cotton seed meal, cows fresh last fall ought to hold out in good shape until pastures are ready next spring.

An Indiana Ration.

I have Jersey and Short-horn cows and would like to have a ration from the following: Clover hay, $7.00 per ton; bran, $20.00; ground oats, $20.00; ground corn, $16,00; whole corn, $16.00; and oil meal, $40.00. I feed at present equal parts of bran, oats and ground corn, and clover hay. A. L. S.
Carthage, Ind.

Are some of these cows Jerseys and the others Short-horns, or are they grades carrying a combination of Jersey and Short-horn blood? Mr. S. is a new subscriber, and we feel like saying to him that we believe in feeding cows according to their size and present capacity for turning feed into milk. A large Short-horn cow requires more feed for the maintenance of her body, than does a small Jersey, and the cow that yields 30 lbs. of milk per day more than one yielding 20 lbs. or less. Without some information along these lines, we can answer his inquiry only in the most general way, by saying that we should feed these cows all the clover hay they will eat twice a day—which will be on an average about 20 lbs. for the entire day. In addition, let them have of the grain mixture from 4 to 8 lbs., regulating the amount by the results which follow. When a dairy cow commences to lay on superfluous flesh, the indications are that the allowance of grain should be reduced.

A Nebraska Ration.

Will you please formulate a balanced ration from the following feeds and prices: Wheat bran, $11.00 per ton; corn and oats, ground half and half, $17.00; wheat shorts, $17.00; prairie hay (good), $5.00; clover hay (second crop) good, $6.00; oat straw, $2.00; corn stover own raising? Would it be advisable to feed any oil meal at prices from $35.00 to $40.00 per ton. The above is for a working herd of Jerseys, in all stages of lactation; weight, 700 to 1,000 lbs. J. J. A
Madison, Neb.

We incline to think that under the conditions stated, it would be advisable to choose the prairie hay and corn stover for roughage, with oat straw for bedding, and use bran and wheat shorts, equal parts by weight, for concentrates. With cows varying so much in weight, and in all stages of lactation, it is impossible to suggest a formula applicable to each individual. The general rule would be to feed all the roughage each cow will eat with good relish and without waste, and supplement this with 4 to 8 lbs. of grain as above. If under this regimen, the cows appear to be somewhat constipated, or the droppings too dry or hard, add enough oil meal to overcome this condition.

Blood Meal and Skim Milk for Calves.

Will you kindly tell me if blood meal is a good combination with skim milk to feed calves as a steady diet? Is it better than oil meal?
What is the price of Prof. Henry's Feeds and Feeding? H. M.
Merriam, Kans.

Blood meal is one of the most useful foods for young pigs and calves when fed judiciously. It should be mixed with the skim milk, commencing with a teaspoonful or so with the very young calf and increasing to a full tablespoonful to a feed as the calf gets to six months or so of age.

The price of Henry's Feeds and Feeding is $2, sent postpaid from this office.

Will Milk Improve in Quality.

I ran up against a man that owns a young cow, ½ Jersey, in her first season for giving milk; he had her milk tested and it showed 4½% butter fat. The party testing the sample stated that while that was good it would test as much as 1% more next year. Is that a fact? C. M. T.
Grant City, Mo.

Testing a sample from a single milking is no criterion of the average quality of a cow's milk. It may happen that a test of this heifer's milk made a few weeks later would show a wide variation, but our observation is that there is no material increase in average per cent of butter fat as the heifer advances in age.

A Vermont Feeding Inquiry.

I have read your paper for three years, and find many helpful things in it. I haven't seen a formula for balanced ration where one has no feed but mixed timothy and clover, not more than one quarter clover. Would you kindly give me one through your paper? Bran, $21; mixed feed, $23; corn meal, $23; cotton seed, $28; gluten, $28. Which would be the most profitable to feed separated milk to cows, or calves which sell at $5.00 or $6.00 at three months old? If fed milk to cows, would they want the same grain ration? Cows are mixed Jersey, Holstein and natives, no thoroughbreds; weigh from 700 to 1,000 pounds.
How much alfalfa seed would it need to the acre? W. L. C.
Newport Center, Vt.

For medium-sized cows, yielding not to exceed 25 lbs. of 4 per cent milk daily, we should prescribe a daily allowance of 20 lbs. of the mixed hay, or as much as each cow would eat without leaving any in her manger, 6 lbs. of bran and 1 lb. of cotton seed meal, with salt twice a day.

Without any accurate data to which we can refer, our guess would be that more profit would result from feeding the skim milk to cows than to calves selling for only $6.00 at three months of age. For each 5 lbs. of skim milk fed to a cow one might deduct 1 lb. of bran from the above allowance.

We sow 25 lbs. of alfalfa seed to the acre.

Silage for Young Mules and Colts.

We are thinking strongly of starting a mule and horse raising industry, and one of the worst obstacles in young animals is the first winter. We intend putting up a silo for cows. Why won't the silo feed do as well for a young colt or young mule, or would it be best to feed the mother from the silo and let the colt remain unweaned until spring? C. F. F.
Fairfax, S. D.

Silage will do very well for a portion of the first winter's feeding, but silage is a carbonaceous feed stuff and therefore not specifically adapted for the growth of muscle. It should be supplemented with alfalfa hay, or in the absence of that, with with some dry fodder and oats.

Impotence. Eastern Dairy Schools.

Will you kindly give me some information through your paper about colleges for young lads who desire to take a course in dairy lore? Is there such a college in Maryland or Pennsylvania; if not, where is the nearest college to Baltimore?
I have a registered bull about 6 years old, who has been allowed to run with a large herd, and when I bought him some two months ago, was very slow in serving. Since I have had him, this defect has been cured, but his cows come back with great regularity. He is a fine bull and I have some of his calves 4 months old.
Roslyn, Md. M. A. E.

When a bull has gained the age of six years, and has previously shown signs of sexual inability or desire, there is but little show for him to grow out of it, and it is not uncommon for him to become unfertile entirely. Your only hope is in giving him all advantages of nature, viz: Allow him to run with the herd so that he will have plenty of fresh air, natural food and exercise.

Write to Prof. W. T. L. Taliaferro, College Park, Md., for information as to Dairy School.

A Kansas Feeding Question.

I have a grade Holstein cow fresh in September, that gives 30 lbs. and more of 4.8 per cent milk. Also have a bull calf from her by a good thoroughbred bull. I feed the cow all the corn ensilage (well eared) and alfalfa hay she will eat, and about 6 lbs. bran per day. Now, I would like to know first: Can I make more and cheaper milk by changing her feed? Second, would it be advisable to keep the calf for a bull? G. L.
Acme, Kan.

We cannot advise any change in the manner of feeding, without information as to the kinds and prices of available feed stuffs, and with that information it is exceedingly doubtful if any change would be desirable. The 30 lbs. of milk as above would make 1 2-3 lbs. of butter, not as much as the cow could be forced to yield with heavier feeding, but the chances are that the increased yield would not cover the increased cost.

As a rule, it is not safe to use any other than full blood sires, because of the probability that more or less of the progeny will take back to the native or scrub ancestry. If the dam of this calf was a full blood, as well as the sire, we see no objection to keeping him to head a herd.

Forage Crops for Kansas.

Have 100 dairy cows and wish to plant some forage crops and want it the cheapest that can reasonably be expected. Would like two crops from same ground if it can be done, and will mention some of the crops that I prefer: Oat hay and peas, millet, sorghum, turnips, beets, etc., and amount of seed per acre, with probable number of tons or bushels per acre.
I will determine later the number of acres to plant, etc. Are beet tops injurious to cows in calf? I like the small turnips best because of thinnings and tops for milk.
Please allow me to thank the DAIRYMAN for the many valuable articles it contains, which are of great value to me, and I presume to others, along these lines. W. L. W.
Kans.

It is a hazardous undertaking to advise specific crops without a pretty thorough personal acquaintance with all the local conditions. We feel quite at liberty in this case, however, to suggest that under what we understand to be the general conditions in Kansas it would be advisable to commence at once to seed down several acres to alfalfa, instead of depend-

THE NEW PATENT
Cow Stall
AND FEED TROUGH.
This is the only Cow Stall with a centering hinge. Stalls all fold back to manger as the cows go out the barn. When ready for use, by starting one stall all come into position. No post at the gutter. Send for circulars.
R. A. McLERY & CO.,
Palmyra, Wis.

ing upon the crops mentioned for dry forage, and in place of the root crops, would grow corn and store it in silos. Every experiment thus far reported goes to show that more nutriment per acre can be produced from corn than from roots and at less expense. Corn silage and alfalfa hay, with a very moderate allowance of grain, makes an ideal ration for milch cows. We should also be disposed to try growing a combination of corn and soja beans in the same row, as described by Mr. Reine in another column.

While waiting for alfalfa to become established, although it will yield some hay the first season, one could raise a crop of oats and peas (1½ bushels of each for seed), and after that probably a crop of millet in a favorable season, but we must beg to be excused from attempting to estimate the probable yield. Where corn will grow as it will in Kansas we would not bother with roots.

We have never known of beet tops injuring cows in calf.

New York Rations.

We have cows that freshened in August last, also in October. We also have cows just freshened and others coming right along. Will you please formulate for me a ration from the following feeds: The best of hay, alsike and red clover, mixed with timothy, $14; corn meal, $24; bran, $22; white middlings, $29; gluten feed, $29; Pillsbury's mixed feed, $25; Royal mixed feed, $24.

Cows are only the common native breed, but have the best of care, warm stable, plenty of water, etc. No silo on this farm, but have a dairy on another farm with silo, silage good, but very little corn in it. Conditions the same otherwise. What or how would you differ the ration on the farm with silo. A. E. L.

Potsdam, N. Y.

Without silage it will be expedient to feed approximately 20 lbs. of hay daily; with silage, feed if possible 40 lbs. of it and about six lbs. of hay; and in either case to the heaviest milkers, say 4 lbs. bran, 2 lbs. corn meal, and 2 lbs. gluten feed. If any of the cows are extra large milkers it may be expedient to increase the grain allowance slightly, but under ordinary conditions we should consider the amounts specified the maximum ration, and for perhaps half the herd they might be materially lessened. We cannot say how much, but a reference to the revised feeding standards published on page 1014, will give some intimation The point is this: These cows are fed to enable them to produce milk, but some of them are small caliber cows; they cannot profitably use but a moderate amount of feed in the production of milk and they should be fed accordingly. The milk of each cow should be weighed every day and a faithful record made and kept for reference. Only by doing this can a dairyman feed intelligently, or, with feeds at the prices named, profitably.

Ration for New York Holsteins.

Will you kindly formulate ration for Holstein cows that have recently freshened.

For roughage have well eared corn ensilage, mixed hay (clover, timothy and red top) cut green and well cured and oat and pea hay. Have wheat bran, ground corn, oil meal and gluten. A. S. C.

Rifton, N. Y.

A daily allowance, substantially as follows, would suffice for cows giving 30 pounds of 4 per cent milk.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.56	.52	5.60	.28
10 lbs. hay	8.53	.48	3.96	.16
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. ground corn	1.78	.16	1.33	.08
2 lbs. gluten feed	1.80	.46	1.01	.05
Totals	26.19	2.12	13.44	.69

This statement is made upon the assumption that the cows are properly housed and otherwise cared for and are fed and milked with reasonable regularity.

For cows yielding 40 lbs. of milk daily, add 2 lbs. of gluten feed to the amounts specified in the table, and increase or decrease the allowance in the same ratio for greater or less yields.

Heifer With Second Calf Doing Poorly.

A three year old grade Jersey heifer was giving last June 24 lbs. of 4.8 % milk per day, 8 months in lactation from first calf. She freshened in September, being entirely dry only 2 weeks, but giving only a small amount for a month before that. Since coming in I have been able to get only 10 to 12 lbs. of milk daily. Have tried the balanced ration you recommended to me, also excess of protein ration and whole oats, but fail to make any increase. She is getting rather fatter than she should, but not excssively so.

Can you recommend any thing to bring her to a normal flow? J. D. M.

Janesville, Iowa.

It is not altogether uncommon for heifers with second calf not to do as well as with first calf, particularly if the first lactation period was exceptionally productive, as it evidently was in this case.

Again, forcing either cows or heifers to go dry against their natural inclination, is very apt to interfere with the yield after freshening. If a cow cannot be completely dried off more than two weeks before coming in milk again, it is better to continue the milking. Probably both of these causes have contributed more or less to our correspondent's disappointment. We do not know of any scheme of feeding that will be likely to to overcome present conditions, but advise feeding according to performance and to prevent fattening. The chances are that with third calf, the heifer will again come up to expectations.

A Sample of Wisconsin Soja Beans.

ED. HOARD'S DAIRYMAN:—Find enclosed sample of soja beans which I raised on my farm last summer, some that I planted with my corn to put in my silo. I planted one bushel of them. I mixed them with the corn and planted with a one-horse drill. This was planted on nine acres of good soil, and that just filled my 16×27 foot silo. What is the result? Good silage!

Next season I will plant about three bushels with same amount of corn.

Vernon Co., Wis. J. G. REINE.

We are again much indebted to Mr. Reine for a valuable bit of information. Last spring he wrote us about his success in putting dry, shocked corn in his silo, and now he furnishes indubitable evidence that the soja bean can be successfully grown in Wisconsin in connection with corn, and make good silage.

We hope to hear from Mr. Reine often, in regard to matters of interest that he works out in a practical way, and trust that others among our readers may follow his example and not hide their light "under a bushel," or otherwise withhold the valuable information that has come to them through their experience.

"ADVERTISEMENT."

QUIT COFFEE

Said the Great German Specialist.

It disappoints some people to be told that coffee causes the disease. But it is best to look squarely at facts and set the face toward health for that's more fun than anything else anyhow. A Cincinnati man consulted a Berlin physician on nervous diseases and says:

"Four years ago I was an habitual coffee drinker having used it for twenty-five years, and being naturally of a nervous temperament I became almost a nervous wreck, greatly suffering from insomnia, almost constantly constipated and weighing only 128 pounds.

"I consulted physicians and took medicine all the time but had no relief. About three years and a half ago I went abroad and while in Berlin heard frequently of a great physician, Prof. Mendel, an authority on nervous trouble, so I resolved to consult him.

"Prof. Mendel surprised me very much by asking at once if I was a coffee drinker and on my telling him I used it two or three times a day he said, 'It is poison.' After carefully examining me he told me there was nothing the matter with me whatever but what could be entirely cured in thirty days by letting coffee and other stimulants alone and dieting.

"I had a hard time following his advice. I did not know what to do until I came home and told my wife who got some Postum. We tried it but at first did not like it; then we went over the directions on the package together and found we had not boiled it long enough. That was the beginning of the end of my trouble for the Postum was delicious after that and I drank it regularly and it helped from the start.

"In a very short time I began to feel much better and in the last three years I haven't been absent from business one hour on account of ill health for my health is fine now. I have a good appetite, sleep well and weigh 175 pounds." Name given by Postum Co., Battle Creek, Mich.

Any nervous person who drinks coffee will feel better from ten days use of Postum in place of coffee. Trial easily proves this. There's a reason.

Look in each package for a copy of the famous little book, "The Road to Wellville."

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are he bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Net Profit *versus* Per Cent Profit.

ED. HOARD'S DAIRYMAN:—A novice in dairying who reads my article on "The Large *versus* the Small Dairy Cow," and then reads Mr. X's comments on the same, entitled, "Another View of the Facts," must be about in the same condition of mind as the cat that went forth into the world in search of wisdom. After meeting and interviewing with unsatisfactory results many of the beasts and birds, she came to the owl, reputed the wisest of them all, and thus addressed him: "I have come far, O, Owl, in search of wisdom; tell me, I pray you, how you have attained to such eminence, that I also may profit." "That is a simple matter; meditate, O,Cat, meditate." "But what shall I meditate upon, O, Wise One that I may attain such wisdom?" "There are many subjects, O, Cat, but I would suggest one on which I spent a lifetime of thought,—which was first, the owl or the egg? Now, we know that the owl comes from the egg; but, from another view of the facts, can we get the egg without the owl? The subject is deep."

So it may seem to the novice that the subject of Net Profit *versus* Per cent Profit is deep—too deep for him to understand. I gave a table by which I showed that the Holstein-Friesian herd at the Wisconsin Experiment Station was much more profitable than the Jersey herd, and then Mr. X takes the same table and shows (?) that the Jerseys were much more profitable than the Holstein-Friesians. As far as figures go, we both seem right; then, what is the matter? Can an animal take a dollar's worth of feed and return a larger per cent profit upon it than another animal, and yet show a smaller net profit for a given time? I answer, yes; and it is readily shown. Again giving a part of the table, I will quote a few lines from Mr. X:

	Holsteins.	*Jerseys.*
Average value products	$94.03	$77.10
Average cost feed	45.46	35.22
Average net profit	48.57	41.88

"Now, the cost of dairy products lies in the cost of feed, labor and care. Included in care is the cost of stabling, bedding, etc.

"It is fair to suppose that the cost of labor and care was about the same for both breeds, but when it comes to the cost of feed, the case was different.

"Now, if the farmer sold $500 worth of feed to those Station Holsteins at the above rate, they would have returned $1,035, which is a first-class return. If he had sold the same value of feed to the Jerseys, they would have returned $1,095, just 12 per cent more upon the investment."

I agree with all that I quote from Mr. X; then where is the error? Let us suppose that Mr. X and I are neighbors and, to simplify matters, have but one cow each. It costs $45.46 to feed my Holstein one year, and she gives $94.03 in return; showing a net profit of $48.57. It costs $35.22 to feed his Jersey, and she returns $77.10; showing a net profit of $41.88. It is evident that the Jersey returns $2.19 for each dollar's worth of food consumed, while the Holstein returns but $2.07. The Jersey is ahead on per cent profit; but how does it work out in actual cow keeping? Let us see:

We begin feeding with the first of the year, and at the end my feed is all gone, while X has $10.24 worth of feed left. I have $94 03 in cash; and if X sells his feed he will have $77.10 plus $10.24, or $87 34; a difference of $6.69 in my favor. But if X refuses to sell his feed and insists on feeding it out, shall I let my cows stand idle? Hardly; and I hustle out after $13.21 worth of feed and we go on. When his feed is used up and we both stop, he has $99.46, while I have $121.30. He has fed $45.46 worth of feed, and I have fed $45.46 plus $13.21, or $58.67 worth. After paying for feed he has $54.00 left and I have $62.63; a balance in my favor of $8.63, or most $2.00 more than at the year's end.

The fallacy in X's argument is in the supposing that I will let my cow stand idle 106 days, while he goes on feeding his, and in his making no allowance for labor and care during the extra time. The per cent profit dogma is one of the most pernicious that can be preached; for it is utterly fallacious. If the Jersey people, who have evolved this foolishness, should follow it to its logical conclusion, they would be obliged to abandon their breed of dairy cattle and go to breeding goats; for no milch animal will return as large a per cent profit on the value of the food consumed as the goat.

This dairy heresy showed up in discussing the results at the Pan-American, and has appeared in the cow census department of the DAIRYMAN, to the great detriment of those who are misled thereby.

Net profit allows the comparison of cow with cow for a fixed period of time. Per cent profit demands that for any comparison the animal consuming the smaller amount shall be allowed to work after the other is supposed to have stopped—an idiotic supposition—and makes no allowance for labor or care or anything else but feed during the extra time.

Is a nanny-goat a more profitable dairy animal than a Jersey cow, because she will show a larger per cent profit on food consumed? MALCOLM H. GARDNER.

Darien, Wis.

American Polled Jersey Cattle Company.

At the annual meeting of the American Polled Jersey Cattle Company held at Cedarville. Ohio, on Jan. 20th, H. N. Coe, Clifton, Ohio, was re-elected President, and J. E. Johnson, Yellow Springs, Ohio, was elected Vice-President. Chas. S. Hatfield, R. F. D. No. 4 Springfield, Ohio, and J. S. Brown, Cedarville, Ohio, were also re-elected Secretary and Treasurer.

The terms of A. T. Mohr and James R. Orr as members of the Board of Directors having expired, and Mr. Mohr declining re-election, H. L. Nash, Xenia, Ohio, and John P. Confer, Yellow Springs, Ohio, were elected to serve for three years.

The official reports of the officers of the company, and reports of breeders present show a steady, solid growth of Polled Jersey interests throughout the country.

DAIRY MARKETS.

We have made up a special lot of 1000 40-quart delivery cans like cut. While they last you can get them at

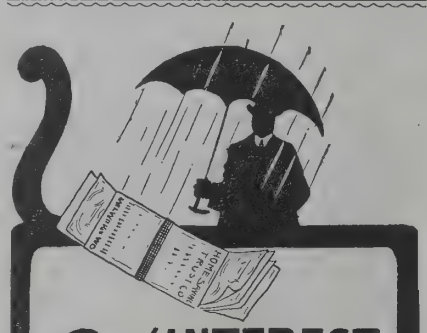
$4.00 Each

This is positively the only satisfactory delivery can on the market. There will be 500 orders for the last one, so do not put it off, send along $4.00 today, and get a can that you would not take $10.00 for. One that is made from the best material procurable; the seams are all loaded, and is as easy to clean as a seamless pan. The faucet is "Perfection", it will not freeze or throw milk all over your wagon; milk runs in a straight stream no matter how small. Made in the largest exclusive milk can factory in the world. Capacity 1000 cans daily.

THE FOREMAN CAN CO., IRWIN, PA.

HELP YOURSELF BY HELPING OTHERS

Co-Operation is what has made all large and successful enterprises, and is what may be relied upon to make farming pay greater profits with less work.



The New National Organization for the Benefit and Promotion of

FARM INDUSTRY

which has just been completed is now preparing to put into practice what has long been sought after by the farmers of this country, big and little, with a view to bettering their conditions and increasing their incomes. A 32-page Booklet, handsomely illustrated, will give full particulars of this new and worthy enterprise, which has been endorsed by the best, most intelligent and influential men in this country. It will interest you and will be sent FREE to any address for the asking. Write today. You will be under no obligations. Address Correspondence Dept. No. 28.

EPITOMIST EXPERIMENT STATION, SPENCER, INDIANA.

Eggs—22@23c; quiet.

BALTIMORE MARKET.

BALTIMORE, Jan. 21—Butter—About the only change of importance to note in the situation of the butter market, since our last issue, is that the quiet feeling prevailing at that time has gradually developed, and the market at the present time is in anything but an encouraging condition. The receipts of all grades suitable for table purposes continue very light; for this kind there is quite a good demand, while stock showing wintry defects are accumulating. There is a fair inquiry for choice to fancy held stock. Imitation creamery and ladles are in amply supply for present needs Rolls, owing to the unsatisfactory quality of the stock arriving, are moving slowly. Packing stock is in ample supply. Blocks and Prints—The supply is about equal the demand. The general market closes quiet and unsettled.

Creamery separator, extras, 23c; firsts, 21@22c; seconds, 18@20c: Held creamery, extra 22c; firsts, 20@21c; seconds, 17@20; imitation creamery, extras, 19c; firsts, 17@18c; seconds, 14@15c; Iowa & N. W. Ladle, extras 16c.; firsts, 15c; seconds, 12@14c; Ohio & Indiana Ladle extras, 15c; firsts, 14c; seconds, 12@13c. Roll, Ohio, extras 15c; firsts, 14c; seconds, 12@13c. Roll, W. Va., extras, 14½c; firsts, 13c; secouds, 12c. Ohio Storepacked, firsts, '3@13½c; seconds 12c. W. Va., firsts, 13c; seconds, 12c. Creamery blocks (2 lbs.) extras, 24c; firsts, 22@23c; seconds, 19@21c. Creamery prints, (½ lb.), extra, 25c; firsts, 23@24c; seconds, 19@21c; Md, Va. & Penna. prints, extras, 23c; firsts, 21@22c; seconds, 18@20c. Renovated butter, extras, 20c; firsts, 18@19c; seconds, 16@17c.

Cheese—While the receipts for the present are very light, the supply on hand is equal to the current needs. There is a firmer feeling prevading the market, particularly on fine stock.

N. Y. State Cheddars, fine, 10½@11c; choice, 9¾@10c; fair, 9@9¼c; do Flats, fine, 11@11½c; choice, 10½@10¾c; fair. 9½@10c; do small, fine, 11½@12c; choice, 10¾@11c; fair, 10@10¼c; Ohio Flats, fine, 10@10½c; choice, 9@9¾c; fair, 8½@9c; Ohio Picnic, fine, 10½@11c; choice, 10@10¼c; fair, 9½@9¾c; Swiss (Domestic) new, fine, 14½@15c; choice. 13@13½c; fair, 10@12c.

Eggs—So far this week the receipts have been very light, while the demand has been quite good at 30 cents; hence, the market is kept quite bare of all desirable stock, and the market generally presents a very healthy appearance; we advise prompt and liberal shipments.

301 Exchange Place. G. M. LAMB & BROS.

NEW YORK MARKET.

NEW YORK, Jan. 23—Butter—Receipts for the week, 26,656 packages. Exports for the week, 1,800 packages.

There was a good wholesome market all the week and the arrivals of fresh make creamery butter was in good demand, and at the close is well cleaned up and prices firm. Extra goods sold at 22@22½c, and good to fine qualities at 19@21c. There were many sales of June creamery for local and Eastern accounts at 18, 19 and 20 cents, and holders were free sellers, accepting any fair offer made by buyers. There is a large stock of freezer goods to be marketed and low prices must continue if the stock is to be cleaned up before the next make comes in the market.

Low grades of butter are selling better, prices, however are low and show big losses to owners. We quote:

Creamery, fresh, extra, 22c; medium, 20@21½c; poor, 15@19c; creamery, June, extra, 19@20c; medium, 17@18c; poor, 15@16c; Dairy, extra, 16@17c; medium, 14@15c, poor, 12½@13c.

Cheese—Receipts for the week, 21,821 boxes. Exports for the week, 7,092 boxes.

The bulk of the arrivals have been of poor quality, say winter make full creams and long lines of poor skimmed cheese from all sections which have no real value, and are offered at all prices from 2 cents up. Fancy cheese hold their own, and are having full as much inquiry as is usual in January. Sales to home trade were at 11¾@12¼c. Exporters have confined their purchases entirely to under grades, paying 7@9c for full creams. and 2@6c for skimmed cheese. We quote:

Full Cream, extra, 12c; medium, 10½@11½c; poor, 7@10c.

Eggs—Receipts for the week, 20,776 cases.

Receipts were light and prices firm all the week, Any small increase in arrivals would knock prices very materially. We quote:

New York and Pennsylvania, strictly fresh, per doz., 32@33c; Western, stricty fresh, 30@32c; Refrigerator, best, 28@30c: poor to good, 25@26c.

DAVID W. LEWIS & Co.

177 Chambers St.

SAN FRANCISCO MARKET.

Jan. 25—Improvements in values for butter were checked yesterday by increased offerings, but under a steady call the market maintained a firm tone at the prevailing prices. While there was plenty of the cheaper quality butter to go round, supplies of really fancy creamery grades were more or less limited, and holders were not disposed to fill orders outside of their regular custom. As a result, prices of the latter stock were strongly held, and occasional sales of the favored brands were recorded as high as 32c, but the top quotation was the conservative rate. General offerings of the cheaper grades were well cared for at quotations, the lots scoring best in quality holding principal flavor. Under increased supplies and a marked inclination to force sales, prices of eggs broke sharply yesterday and the market presented an easy undertone at the decline. Buyers were cautious and limited their purchases to actual requirements in anticipation of further reductions in price. Cheese was in oversupply and an easy market ruled at unchanged prices.

Receipts yesterday aggregated 46,700 pounds butter, 1,142 cases eggs and 6,300 pounds of cheese.

Butter—Creamery, extras, 31c; good to fancy, 27½@30c; dairy, extras, 25@26c; dairy, choice, 22@24c; store, 17@18c; California storage, 21@24; eastern creamery, nominal.

Eggs—Ranch, selected large, 27@27½c; good to choice, 24@26c; store, 21@23c; California storage, nominal; eastern, nominal.

Cheese—California creamery, mild, new, extra, 13@13½c; mild, new, choice, 12@12½c: Young, America, 13@14c; eastern. New York, Cream, Cheddars and Flats, new, 14@16c.

Report of the Vermont Dairymen's Convention.

(Continued from page 1157)

of dividing a sum of money among the patrons of a winning creamery as an incentive to increased effort in their business.

Farmers should come more to the front, fit themselves for recognition by the real merit of their achievements, instead of remaining in the background. They would, he thought, find it of advantage to employ more help on their farms.

Prof. Decker of Ohio, was the last speaker of the afternoon. He rightly stated that success in dairying d epends on "the man behind the cow." He spoke about the many improvements that have been made in dairy machinery and appliances within the past few years.

Before adjourning a business meeting was held, and the following officers elected for the ensuing year:

President, H. H. Bruce of Sharon; First Vice President, Geo. H. Ferrill of Morristown; Second Vice President, F. G. Bronson of East Hardwick; Secretary, F. L. Davis North Pomfret; Treasurer, M. A. Adams of Derby; Auditor, C. F. Smith of Morrisville.

At a business meeting of the Woman's Auxilliary, the following list of officers were elected for the coming year:

President, Mrs. Etta La Page of Barre; Vice President, Mrs. M. L. Aseltine of Fairfax; Secretary, Mrs. W. B. Beach of Charlotte.

The Banquet.

There was no evening session, but instead the annual banquet at the Van Ness House. This was the largest gathering of this kind ever held at this house. There were 333 sat down at the table where they were abundantly served, after which came the post prandial exercises. These were of a most interesting character and highly enjoyed by all present. The Howard Opera House orchestra furnished excellent music, and group of students from the University of Vermont, exhibited their interest with college yells and songs.

President Aitken called the guests to order and after a short speech by Prof. Hills, introduced D. J. Foster M. C. of Burlington, who acted as toastmaster, presided with the ease and grace for which he is so much noted. The speakers responding to call were Lieut. Gov. Fred S. Stanton of Roxbury; Hon. H. C. Adams, Wis.; W. J. Van Patten, Burlington; Gov. Hoard, Wis.; D. M. Walsby president of the senior class at the University of Vermont; Prof. Decker of Ohio. This completed a day filled with good things and it is hoped long to be remembered.

Thursday was the last day of the convention. At the morning session, George M. Whitaker, of Boston, former publisher of the *New England Farmer*, spoke on the work of the Dairy department at Washington. He referred to the great advancement made by farmers in dairying during the past few years, and said that the progress was due in large measure to the experiments conducted at the experiment stations and farms and by students. He spoke of the work being done by the department at Washington, as encouraging and helpful. He referred to the Grout oleomargarine bill and stated that farmers throughout the country would hold ex-representative Grout in grateful memory for the good work that he had performed.

H. C. Adams of Wisconsin was the last speaker of the morning. His subject was "Dairy and Food Laws." He spoke at length of the struggle in Congress for the passage of laws against the adulteration of certain food products, especially cheese and flour. He spoke particularly of the long fight over the oleomargarine bill and the final victory. His remarks were listened to with much attention and interest.

At the afternoon and last session of the convention, the first speaker was Henry Van Dresser and his subject, "The Selection and Conformation of the Dairy Cow," upon which he spoke most interestingly, showing his familiarity with the topic he discussed. He spoke of the importance of weeding out the unprofitab e cows from the dairy and of better care and management in general, if the best results are expected. The address was full of good points and should awaken increased interest in the management of the dairy.

Gov. McCullough was called upon to address the convention and responded in his usual very pleasing manner. Our agriculturallists, he said, are the kings of America. From one-third to two-fifths of the people of this country are in some way connected with the soil, and from the soil is drawn the wealth of the nation.

At the close of the governor's remarks, the college boys gave a hearty cheer, and the president announced the close of the 34th convention of the Vermont Dairymen's Association, after a most interesting and profitable gathering.

Premiums Awarded on the Exhibits of Butter and Cheese.

The following premiums were awarded on the exhibits of butter and cheese. In butter there were 141 entries, the highest score being 98½, the lowest 88 and the average 94⅓. In cheese there were 17 entries, the highest score being 98½, the lowest 93 and the average 96. Following were the awards.

Butter.

W. P. Stone of Strafford. score 98½, gold medal, creamery sweepstakes and grand sweepstakes,

J. B. Candon of Pittsford, score 98, dairy sweeptakes.

J. H. Chapman & Son of Clarendon Springs, score 97, best displayed package,

Dairy Tub.

J. B. Candon of Pittsford, score 98, first prize; C. A, Choate of West Barnet, score 97½, second prize; Chas. LaPage of Barre, score 97, third prize.

Dairy Box.

H. B. Leonard of North Pomfret score 97, first prize; H. S. Eldred of Sheldon. score 96½, second prize; R. W. Burnett of Bristol, score 96, third prize.

Dairy Prints.

J. H. Chapman & Sons, score 97, first prize; Mrs. C. J. N. Shackford of East Ryegate, score 96¾, second prize; C. F. Stafford of Chippenhook, score 96½, third prize.

Creamery Tub.

W. P. Stone of Strafford, score 98½, first prize; C. C. Fuller of Jonesville, second prize; E. F. Thayer of Warren, score 97¾, third prize.

Creamery Prints.

A. E. Sherburne of North Pomfret, score 98, first prize; E. K. Hill of Greensbor, score 96, second prize; C. C. Lawless of Montopelier,score 95, third prize.

Cheese Sweepstakes.

F. G. Stone of Dorset, score 98½.

Dairy Plain.

Mrs. W. A. Franklin of Brattleboro, score, 95 first prize; J. C. Oliver of Charleston, score 94, second prize.

Dairy Sage.

J. C. Oliver, of Charleston, score 95, first prize; Mrs. W. A. Franklin of Brattleboro, score 94, second prize.

Factory Plain.

H. W. Rice of Westford, score 98, first prize; F. G. Stone of Dorset, score 97½, second prize; Burr Harwood of Dorset, score 97, third prize.

Factory Sage.

F. G. Stone of Dorset, score 98½, first prize; H. W. Rice of Westford, score 98, second prize; A. R. Potter of Oakland, score 97½, third prize.

Besides the above premiums, there was a considerable sum divided among a large number of exhibitors whose butter scored above a certain point. Also there were many special premiums offered by individuals, manufacturers, etc, outside of those of the association which added to the long list awarded at the meeting.

There was quite an extensive display of dairy apparatus and machinery, but for exhibition only. Among these may be particularly mentioned the exhibits made by the Vermont Farm Machine Co. of Bellows Falls, and of the Stoddard Manufacturing Co. of Rutland. The first, manufacture and sell the United States separators, the last the DeLaval. Both make a large variety of apparatus and machines for creamery and dairy work. There were other exhibits, but these are particularly mentioned because they are Vermont enterprises, and have so close a connection with our dairy industry, although well known throughout the United States.

E. R. Towle.

Franklin Co., Vt.

The Present Butter Standard.

Ed. Hoard's Dairyman:--There seems to be quite an agitation at the present time throughout the country on pure foods and standards for the same. Many of our states that have no laws on this subject are preparing to enact some, on account of the fact that food adulteration is becoming so common.

R. M. Allen, Secretary of the National Association of State Dairy and Food Departments, says in his report published in the *Record-Herald* of December 30th, that England seems to be the dumping ground of all adulterated foods from other countries, and that they are putting forth efforts to stamp out this evil. In the preparation of laws on this subject of pure foods and standards, great care should be exercised in not going to the other extreme by making standards that will be

Milk Pails

The accompanying cut is a true representation of our Gurler Sanitary Milk Pail. The merits of this pail have been fully discussed and endorsements have been given by many practical dairymen whose articles on this subject have appeared in recent issues of this paper.

Made of the best quality 6X block tin with all seams soldered smoothly.

Where the use of sterilized gauze and absorbent cotton is desired one has simply to remove the top, put cloths in position and replace it.

Give it a trial and be convinced of its superiority over all other kinds.

Did You Ever Keep a Record Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want."

DAILY MILK RECORD SHEET FOR TEN COWS

We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at the following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c

SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

HOARD'S DAIRYMAN.
FORT ATKINSON, WIS.

Salzer's Alfalfa or Lucerne

Glory enough! Ring the bells! Shout for joy! The year of jubilee has come! How's that! Why, sir, it has been made possible to grow Salzer's Alfalfa Clover in every state in the Union, North, South, East or West—why, sir, cold Minnesota and freezing Wisconsin, and treeless Nebraska, and the prairies of Illinois and Iowa, and the bottoms of Indiana, and the pineless soil of Michigan, and the rich farms of New York and Pennsylvania—yes, every state can grow from two to four crops of Alfalfa, if **Salzer's Northern Grown Alfalfa** seed is used! That's acclimated, that's hardy, that's tough, and we believe tougher and better than the Turkestan Alfalfa.

It's a Wonderful Clover

It's the greatest clover on earth. it's extremely early, the first crop cut in May, the second prodigal yield in July, the third in August, and lots and lots of pasture besides. It's great as a fertilizer, sending 10 to 25 feet after moisture and nourishment. It withstands drouth, wet, indeed, when once established it defies all elements, returning yields that will gladden the heart and fill the purse of every farmer growing same,

Look at This Testimonial

Carl G. Kleinstueck, Saxonia Farm, Mich., has this to say: "I have a patch of Salzer's Alfalfa Clover that I seeded 13 years ago, which yielded four big crops last year, besides good fall pasture. It has been cut three times already this season, and the fourth crop is about six inches high today, and will be ready for mowing in about three weeks."

We have hundreds like it coming from all parts of the United States. It will pay you, Mr. Farmer, to give Salzer's Alfalfa a trial.

For 6 Cents

If you will mention Hoard's Dairyman when you write, enclosing 6 cents in stamps, we will mail you a sample package of **Salzer's Northern Grown Alfalfa Clover Seed**, as also our catalogue that contains the full description of how to grow with success this wonderously luxuriant hay and grass producing plant. Send today 6 cents in stamps for above and be sure to mention Hoard's Dairyman.

JOHN A. SALZER SEED CO., LaCrosse, Wis.

continually violated. I fully realize the difficulty that is encountered in getting a law or a standard that will be suitable to all. Two of the standards published in the recommendations of the Department of Agriculture some time ago, are of the kind that would be violated. I refer to the standards for butter, which must not contain less than 82.5 per cent of butter-fat, and milk, to contain not less than 12% of the total solids, and not less than 8.5 per cent of solids not fat, nor not less than 3.25 per cent of milk fat.

In ordinary, good, commercial butter, we have a total of about four per cent salt, casein and ash. Taking the standard of 82½ per cent fat, this would leave us 13½ per cent of water, or 2½ per cent lower than what is recognized as the world's standard.

The food laws of the world are in part copies of the English law. The English people have made extensive inquiries into the extent and cause of food adulterations, and their probable effect upon the health of the people. Owing to the great agitation of the people on this subject, a committee was appointed three years ago by the English parliament to prepare a standard for butter? Representatives were called from those countries which shipped butter to England, Holland, Denmark, Sweden, United States, Norway, France and Germany. After careful consideration they recommended what they considered a low standard of 16 per cent of water as a maximum. This was considered too low by the majority of exporters to England. While this standard has never been adopted by the English parliament, it has been recognized and adopted by other countries.

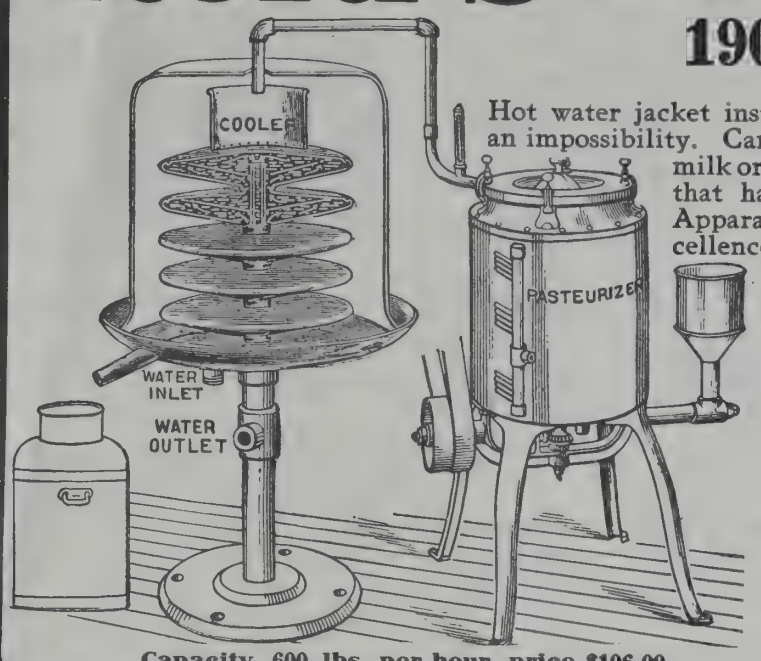
If a conservative people of consumers, like the English, adopt or recommend a standard of 16 per cent for water and consider it low, why should we, a nation of producers, want to adopt a standard which is practically 2½ per cent lower?

The English people are thoroughly posted on this subject, having from Mr. Allen's report analyzed last year seventy-three thousand samples of food products, or an increase of five thousand over the previous year, thus giving an average of one sample to every four hundred and fifty of the population of the whole country. The majority of the samples analyzed were butter and milk. In fact, from Mr. Allen's report little else has been done with the general food supply.

The 16 per cent water as recommended by the English Parliament was considered so low by the Irish dairymen, that concessions were made by the committee last year, allowing Irish dairy butter, or what is sometimes termed Irish pickled butter, to contain twenty per cent water. Quite a lot of butter is made in Ireland in home dairies, and it was found that a standard of 16 per cent would injure this industry; hence a concession was made for Irish pickled butter. This butter is packed in warm brine, and it takes up great quantities of water from the brine, containing sometimes as much as 25 per cent water.

Butter, like many other foods, is not eaten particularly for its nutritive value. It is used more as a relish in connection with other foods rich in protein. Instinct taught this before scientists thought of it. Bread is rich in protein and butter rich in fat. We spread the butter on the bread and have a combination demanded by the system. A person would starve if compelled to live on butter alone. Many foods have their commercial as well as their nutritive value. To have the former, they must have certian specific qualities. Flavor is a predominant factor in controlling the prices of various food products. Well cured Cheddar cheese contains about twice the nutritive value of beef, yet it will not sell for twice as much, and in some cases does not bring as much, pound for pound, as the best cut of beef. The same is true of many varieties of our fruits. Different varieties of apples may possess the same nutritive value, while the commercial value will vary widely, owing to the difference in flavor. Under this same heading come strawberries and raspberries, containing nearly 87 per cent water; yet their commercial value is great.

While the standards referred to are not a law at the present time, there is danger of their being adopted by some states and becoming a law; therefore, they should be thoroughly discussed and understood by the dairymen of the country, especially the producer.



The first consideration in the enactment of any law is, that it should be made workable, without imposing on the innocent. If the 2½ per cent increase of fat would improve the quality of American butter or increase its commercial value, it might not be objected to. The writer has given this subject much thought and attention during the past two years. Three years ago when visiting the London (England) market, I had the opportunity of examining butter from practically all the leading dairy countries of the world. I made a number of tests for moisture, and the driest butter found was from New Zealand. This sold for three cents per pound less than the Danish selected and the French rolls, which contained four or five per cent more moisture.

During the past year we have been carrying on an educational scoring contest. Each exhibitor was requested to send in a twenty-pound tub of his average make, every other month throughout the year. The butter was scored at Ames, and samples were taken from each tub for chemical analysis. The butter was kept at Ames for seven or eight days, when it was shipped to New York and re-scored by Mr. Healy, the well known butter expert, making a lapse of time of fifteen or sixteen days between scorings, thus giving us a fair knowledge of the keeping qualities of the butter. The first score showed the quality when fresh, and the chemical analysis together with the scores of the two judges, gave some reliable data as to what composition of butter was most desirable for commercial purposes.

Results from five tests have been obtained, and the scores have shown that butter containing less than 82 per cent has as great commercial value, if not greater, than that containing more fat. So eighty per cent fat, which would mean about sixteen per cent water, would be a safer standard to adopt. All foods contain more or less water, cheese running from about 27 per cent to 44 per cent, bread over 35 per cent, our fine sirloin steak 54 per cent, tenderloin 66½ per cent and as dry a substance as flour contains 12 per cent water. The moisture in fish ranges from 34 to 87 per cent. Why then, should we want to limit butter to contain only 13½ per cent water? Such a standard would be constantly violated by the producer, unintentionally, and it would be almost impossible for the government to enforce such a law.

Out of one hundred and ninety-two lots of butter received in our educational contest, thirty-seven contained less than eighty-two per cent fat, or 29.3 per cent could have been declared adulterated butter under the standard of 82½ per cent fat. If 29.3 per cent of the butter sent in, representing fifty-five creameries in one state, could be classed as adultered butter, some idea can be formed of the amount of violations there would

Reid's Improved Pasteurizing Plant 1904 Pattern

Hot water jacket instead of steam. Makes scorching an impossibility. Cannot impart a *cooked* flavor to the milk or cream. Embodies all the features that have made the Reid Pasteurizing Apparatus the standard of creamery excellence. Removes every possible odor and impurity. Made of copper. No wood; hence absolutely sanitary. Simple in construction—easily cleaned.

Write for information and complete descriptive catalogue of Pasteurizers, Coolers, Separators and all Dairy supplies.

be throughout the United States if the new standard were adopted.

Butter is composed of casein, fat, salt and water. The amount of casein varies but little from time to time. The amount of salt varies considerably, depending upon the requirements of the market. The water content of butter depends somewhat on the skill of the operator, varying usually from eight to eighteen per cent, very seldom reaching the latter, and the flavor is largely held in solution.

In our last educational contest, the second highest scoring lot of butter contained a fraction over sixteen per cent of water, or about three per cent above the new standard of 82½ per cent fat.

The loss from such a standard would fall on the producer or the dairyman, and would strike the dairy business a very severe blow, especially in Iowa, Wisconsin, Illinois and Minnesota, as these states are large producers of butter.

Taking up the standard of 3.25 per cent fat for milk, if this were to become a law, hundreds of dairymen could be constantly prosecuted for adulteration of milk, over which they have no control. This is quite evident to every creameryman in the country. Many of our very fine Holstein cows that have made wonderful records as butter producers, would come under the ban of the law, and some of our other grades and breeds that are not Holsteins would at times be condemned. Three per cent at the most should be high enough for a standard of this kind. I see no objections to the standard for the other solids, not fat, as published in the recommendations. The two standards mentioned above are certainly of great interest to dairymen.

G. L. McKAY,
Professor of Dairying.
Iowa State College.

A Plain Spoken Letter from New York.

ED. HOARD'S DAIRYMAN:—I listened with much interest to the several addresses of the senior editor of the DAIRYMAN at the Ogdensburg Dairy convention. He also spoke to our farmers at West Stockholm and at Madrid. He spoke the words of earnest conviction and sober truth and I wish to assure him that his efforts were most heartily appreciated. Never mind the small souled editor the *Country Gentleman*. His exhibition of petty spite and jealousy in his malignant allusions to Mr. Hoard, are characteristic of the man. It will not be long before the dairy farmers of New York will have taken his measure in full.

But that is enough on that disagreeable point. What I started to say was that the line of thought pursued by Mr. Hoard is, in my opinion, the true line for all New York dairymen to pursue. We have been drifting away from the solid moorings of fertility in the soil. Our fathers believed in that religiously. The present generation of farmers must confess to the truth of the indictment that there has come two very serious declines, a decline of fertility and a decline of value as shown in the prices of our farm lands.

We must face then two ugly facts. There has been no decline in the value of cows or their products. Now, what has brought these two evils? My answer is much the same as that given by Mr. Hoard. Mere mechanical farming, without the excercise of live, up-to-date brains; farming in a rut. We have been at it 40 years. We have forgotten some of the good things our fathers knew. Clover, for instance; and we have not kept our brains alive to the things modern science has brought to help us out.

We have seen our land grow steadily poorer, and our capital fade out, in the price our lands would sell for, and about all we have done is to lay the blame on the west. We have acted too much like children and not like able-bodied and able-minded men. The first thing in the way of reform to my mind, is to go back to what the old farmers did—sow more clover, keep raising it, sow it with every crop of grain. Whether we expect to seed down the land or not, sow it, as Mr. Hoard said he sowed it, at the rate of 20 pounds to the acre. No matter if it does not last but one year, we are richly ahead on that deal even then. It would bring back the old days of fine crops, if New York farmers would launch out boldly on this clover question. Not one man among them in twenty really knows of his own experience what clover can do for his farm.

Almost every farmer is afraid, has but little good, hearty agricultural pluck. We have been smitten by the paralysis of disbelief and do-nothing skepticism. "It won't pay" is heard concerning almost every proposed reform in our methods.

It would be hard to find any kind of farming that "don't pay" any worse than that kind we are doing now.

A few men in every county have got their eyes open; they are taking hold of every help that modern thought and progress has brought them. They find it pays to sow clover constantly; it pays to grade up the cows by good dairy blood; it pays to overhaul the old, dark, damp, foul stables, and make them light, dry and with pure air; it pays to keep fertility in the farm, dairy qualities in the

ST. LAMBERT BULL CALVES by Lucy Stoke Pogis 4th, sire of 13 tested cows, $25.00.
W. J. HUSSEY, Mt. Pleasant, O.

HILLCREST JERSEY HERD.
Bulls for sale out of famous St. Lambert Cows, headed by King of Hillcrest, 61858, by Hart's King of St. Lambert's King, 30752. Some fine Bull Calves and Bulls ready for service cheap if taken soon. For prices and pedigrees address
H. C. JOHNSON, GATES MILLS, OHIO.

HIGH CLASS JERSEY BULLS
Heifers and Cows for sale. My foundation stock the best I could buy from a herd famous for merit Write for what you want.
WM. B. GOODRICH, CLIMBING HILL, IOWA

PROSPECT HILL JERSEY HERD
The cow that can DO something is what the farmers want. Eight cows have finished their official year's work making an average of 524 lbs. each. F. H. SCRIBNER, Rosendale, Wis.

VALLEY FARM is offering some bargains in young bulls sired by "Diploma's Victor, No. 56310, Grandson of "Brown Bessie," or will exchange for heifers equally well bred. For prices and pedigrees write Fred Stubley, Black Earth, Wis.

FOR SALE. Two A. J. C. C. Bulls ready for service; also some younger ones. Cows and heifers in calf to richly bred bulls. Write for pedigrees and prices. We have a few Berkshire Boar Pigs from unregistered sows left; cheap.
N. N. PALMER & SON, Brodhead, Wis.

POLLED JERSEYS
Richest Cow of all breeds in Pan-American Model Dairy. Winning Herd at Ohio and New York State Fairs, 1903. W. H. FORBES & CO., Yellow Springs R. R. No. 1, Ohio.

NAIAD OF ST. LAMBERT
Was a great cow. Aside from her official test she was a full sister of Mary Anne of St. Lambert (36.12 in seven days, 867.14 in a year) and her owner once refused $15,000 for her. Sale List A 21 contains a cow by a son of "Naiad", out of a grand-daughter of "Exile" with a weekly test of 19.10 and a milk record for one year of 11713 lbs., equal in butter fat to 739 9-10 lbs. butter. This cow is due soon to a grandson and great-grandson of "Naiad". Nearly all on this Sale List are deep in St. Lambert blood. It comprises fresh cows, cows nearing calving, heifers, and heifer calves. If interested write for pedigree of cow, and for List A 21.
WINTERGREEN HILL FARM,
SCOTTSVILLE, N. Y.

A. J. WELKER, ATTICA, N. Y.

cows, and good, sound dairy sense in our minds.

We must take more interest, as the DAIRYMAN says, "live, mental interest," in our farming business. Why not be an enthusiastic dairy farmer, rather than go at it unwillingly every morning, as if one had been whipped to it?

If we will put more pride, enthusiasm and ambition in our work; these qualities will soon lead us out to the knowledge we need to acquire. But whoever saw an unwilling scholar learn, with ever so good a teacher? There is a grand future ahead for the New York dairy farmers in my opinion, if they will but open their eyes to the logic of events. They have the greatest of markets right at their door; they have cheap farms that require but little fixed capital to start with.

All that is required of them is to reach out and take hold of what modern science can do for them to bring up the soil, the cow, and a more intelligent idea of feeds and feeding. We are learning too slowly, only about as fast as the land is wearing out. You in the West will come to it sometime if you don't look out.

Keeping up the fertility is at the bottom of the whole problem. You were right Mr. Editor when you told us at Ogdensburg that any kind of farming which wasted the fertility of the farm was a failure. Keep up your preaching, never mind what bigots or fools may say; keep at it. The dairy farmers of New York are your friends. Yours truly,

Ogdensburg, N. Y. J. F. D.

Wrong Treatment of Alfalfa.

ED. HOARD'S DAIRYMAN:—Last spring I plowed under a piece of clover sod, manured heavy and sowed to alfalfa. Got a splendid stand and clipped four times. About October first it began to die and by November twentieth, it was all gone. Can you give any reason? W. H.

Wautua, Ohio.

It is our belief that the killing of the alfalfa was due to the excessive cutting it underwent. We have often noticed the foolish advice which has been given, to cut the young alfalfa several times the first season in order to kill the weeds. It does not seem to have occurred to these advisers that if such cutting is disastrous to the weeds, it must also be just as disastrous to the young alfalfa. What we want above everything else is to get the strongest and longest root growth on the young alfalfa the first summer.

To succeed in this, the plant must have all the top growth that it is possible for it to make. There is considerable of humbug in this talk about weeds. Our advice in all such cases is to let the alfalfa alone and let it make all the growth it possibly can. We hope our friend will not get discouraged, but try another piece the coming spring. Select a piece of high, rolling land, rich soil, plough once, disc twice and harrow twice. Then sow 30 lbs. to the acre and let it alone, save to give it about 300 lbs. of muriate of potash to the acre when sown.

The Breeders' Consignment Sale of Holsteins,

We are pleased to publish in this issue the pictures of the well known breeders of Holstein cattle, Mr. T. A. Mitchell, Weedsport, N. Y., and Mr. Ward Stevens, Lacona, N. Y. These gentlemen are members of the Breeders' Consignment Sale Co., of Holstein cattle, Syracuse, N. Y., which is composed of the following well and favorably known breeders: H. L. Bronson, Cortland, N. Y.; H. A. Moyer, Syracuse, N. Y.; H. P. Knowles, Worcester, Mass.; A. A. Cortelyou, Neshanic Station, N. J.; Stevens Bros,, Lacona, N. Y.; and T. A. Mitchell, Weedsport, N. Y.

Messrs. Mitchell and Stevens are now in Holland, having been selected as a committee to visit the largest and best known breeders of that country with instructions to pick out at least fifty head of the finest young heifers to be found, and with the reputation that these gentlemen have for being good judges of this breed, we may certainly have reason to believe that they will bring back some very fine animals. This importation with about 125 head more of the best strains in this country, will be placed in their semi-annual sale, which will be held on the New York State fair grounds, June next.

T. A. MITCHELL.

WARD STEVENS.

Dairy Questions Answered by Prof. Farrington.

CREAMERY AND CHEESE FACTORY COMPARED.

"Will you please give me a little advice. I am a beginner in the dairy business and would like to know what I shall do. I have been sending cream to a butter factory and have averaged $36.00 per cow for fourteen cows during the year. My neighbors are building a cheese factory and want my milk. What shall I do? I have a hand separator and the butter maker gets the cream free of charge for hauling. How can I figure out the returns I shall receive at the creamery and the cheese factory? How do whey and skim milk compare in feeding value and in the amount of fertility that is carried away from the farm?"
Leland, Wis.

* * *

In reply to your letter received some time ago I beg to say that in making a decision as to whether you will patronize a creamery or a cheese factory you should take into consideration the market price of butter and of cheese as well as the difference in the feeding value between skim milk and whey. Careful experiments have demonstrated that the feeding value of whey is about half that of skim milk when fed to pigs; that is to say, 100 pounds of skim milk are about equal to 200 pounds of whey for feeding purposes.

In calculating the amount of butter and of cheese that will be made from your milk, it is fair to assume that approximately ten pounds of cheese will be made from 100 pounds of your milk, provided the milk tests about four per cent fat, and that the same milk ought to make about 4½ pounds of butter. The average price of cheese may be placed at 8 cents so that the cheese value of your mllk will probably be 80 cents per hundred and if to this you add the feeding value of the whey, which will possibly be ten cents, the amount received per hundred pounds of your milk at a cheese factory may be calculated at 90 cents.

If butter is made from your milk the 4½ pounds of butter at 20 cents a pound will amount to 90 cents and if the feeding value of the skim milk is twice that of whey, the skim milk will be worth 20 cents, which added to 90 cents makes $1.10, which will be received for your milk if it is made into butter on this basis.

As you have a hand separator the skimming of the milk at home will probably off-set the work of drawing your milk to a cheese factory, so that at the price mentioned you will get more for your milk by patronizing a creamery than a cheese factory. This, however, should not be taken as a conclusive argument but simply an indication of the method by which you may figure the returns that you will receive by patronizing either a creamery or a cheese factory.

Compare the price paid for cheese and for butter to the patrons at the two factories and then make the calculations yourself as to how much butter and cheese your milk will make, then assume that the feeding value of the skim milk is twice that of the whey, and you should be able to determine for yourself which factory you want to patronize.

In selling milk to a cheese factory some more fertility is carried away from the farm than by selling milk to a creamery and keeping the skim milk at home. The reason for this is the fact that cheese contains considerably more of the fertilizing ingredients of the soil than butter fat contains.

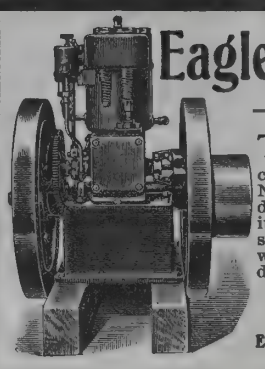
STRONG ACID IN TESTING.

"Is it possible for sulphuric acid to be in such a condition as to make milk test too high? A certain party in this territory did some testing and then the next day he came back and said his acid was too strong and this made the tests too high. He took some new samples the next morning and his second tests were much lower than the first ones. He says the difference in test was due to the strength of the acid used in the two cases. I think my tests are running too high, but I can not blame it to the acid."
Woodlawn, Wis.

* * *

I do not think it is possible for sulphuric acid to increase the test of milk, because there is no fat whatever in the acid itself. It is a fact, however, that when samples of milk are tested with an acid which is too weak the results are apt to come low because the acid is not strong enough to dissolve all the curd in the milk and liberate all the fat from it. If, therefore, you get a higher test of the same sample of milk by using a stronger acid than was obtained with the weak acid, the result is undoubtedly due to the more complete action of the strong acid on the milk than was obtained when the weak acid was used.

It is not often that a difference in strength of acid is the cause of inaccurate testing, because a too weak acid interferes with a clear separation of the fat and the operator will notice that something is the matter with his test.

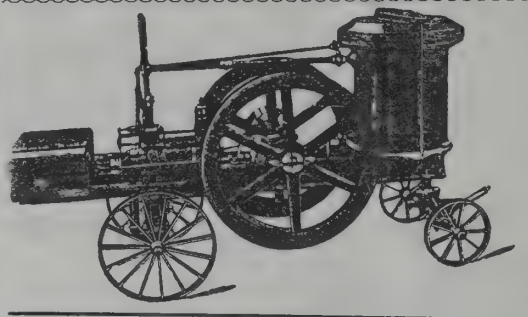


The variation in the tests of the samples you ask about is probably due to the difference in the quality of the samples tested. It is very necessary that milk should be thoroughly mixed if duplicate samples are to be tested from the same lot. It is quite possible that the differences noticed are due to a failure to get a

The "Penny Wise and Pound Foolish"

Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.



Eagle 4 H. P. Stationary Engine

1904 MODEL

THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. ICE CUTTING

is easy with DORSCH ALL STEEL, DOUBLE-ROW ICE PLOWS. Marks and cuts two rows at a time; cuts any size cake and any depth, and does it with ease and economy. Does the work of 20 men sawing by hand. Pays for itself in two days. No farmer, dairyman, hotel man or other can afford to be without it. Have a supply of ice and enjoy the comforts of life in the Summer. Ask for catalogue and introductory prices. JOHN DORSCH & SONS, 212 Wells St., Milwaukee, Wis

Made in Three Sizes.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "THE MASTER WORKMAN"

A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Has no vibration; can be mounted on any light wagon as a portable. Weighs less than half of one-cylinder engines. Give size of engine required. Especially adapted for irrigation in connection with our centrifugal force pumps. (Sizes 2, 2½, 4, 5, 6, 8, 10, 12 and 16 horse power. Mention this paper. Send for catalogue.
THE TEMPLE PUMP CO., Meagher and 15th Sts., CHICAGO.

fair sample of milk in both cases.

Too high tests may also be due to making the tests in a turbine tester which heats the bottles up to a high temperature and expands the fat so that the reading of the tests is exaggerated. The fat in the test bottles should have a temperature of about 140° when they are read. When this is done and the fat is read at a uniform temperature each time, I think tests may be made by two different parties, from the same lot of milk, and the results agree very closely.

BUTTER MAKING PRICES.

"I have a chance to start a creamery for the farmers in this neighborhood. They want to put up the building and do the hauling of ice, wood, etc. They want me to put in all the machinery, pay all running expenses and deliver the butter to a railroad six miles from the factory. What should I charge the farmers per lb. of butter for making under these conditions? I do not know how to make a contract so as to get everything fair and satisfactory for both parties. I wish you would give me a sample contract so that I may know how to start this enterprise for my own benefit and for the farmers also.

Hart, Minn.

* * *

From the description given in your letter of the conditions under which you are requested to operate the creamery, I should think the patrons ought to be willing to pay you four cents a pound for making the butter at the beginning of the enterprise. If they will allow you this much until the machinery is paid for and the milk supply increases so that you get somewhere near ten thousand pounds of milk in the summer, you will probably be able to reduce the price to three cents per pound of butter in the future. There are some large co-operative factories that are able to make butter for less than 3 cents per pound, but they receive twenty thousand pounds of milk per day and in some cases more than this. Under such conditions the butter can be had at a less price per pound than when the factory is new and it is uncertain how much milk it will receive.

A contract which ought to be satisfactory to all parties concerned, may read as follows:

"I hereby agree to buy all the machinery necessary for equipping a creamery, and to make the butter for such farmers as may patronize the factory, at the rate of four cents per pound for making for one year, provided not less than an average of five thousand pounds of milk per day are received at the factory during the year."

Such a contract as this is a fair one for both you and the farmers. This is assuming, of course, that there is a reasonable certainty of your receiving so much milk as this. You should canvass the territory and ascertain the sentiment of the farmers thoroughly, before investing your money in the necessary equipment of the factory, because it would be a losing investment for you to buy all the machinery and then operate the factory for only a short time.

If such a contract as this is agreed to for one year, you will be able at the end of that time to get acquainted with the community and will probably be able to make a contract by which you can produce the butter cheaper the next year. One year at a time, however, is sufficient for making such a contract as this.

USING A CREAM WEIGHING SCALE.

"Will you please send me directions for using a cream weighing scale and explain to me how to test cream from hand separators? This is something new to me. I do not know how to test cream as I have always taken in milk at the factory heretofore."

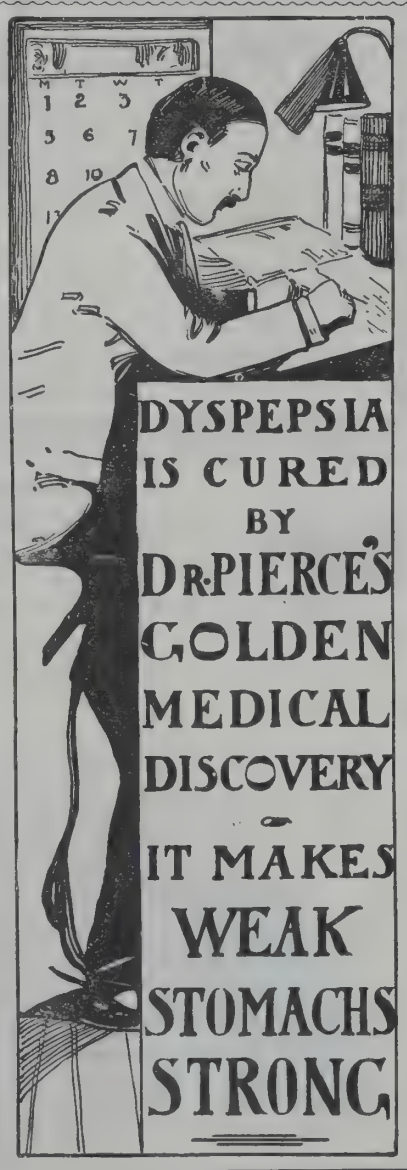
Little Black, Wis.

* * *

Scales for weighing cream when using the Babcock test should be so made that they will easily be moved by even a small drop of cream when it is dropped into the test bottle. This is the one important point to be noticed in buying a cream scale. It should be sensitive and in order to keep it sensitive it is essential that a scale should have agate bearings. Such cream weighing scales as these are now on the market and sell at a price of $10.00 I believe.

The way in which these scales are used is the following: The scales are first tried and made to balance accurately with bits of paper or other material. A dry test bottle is then put on one pan and a weight on the other; to exactly balance it; from five to ten c. c. of cream is then allowed to flow into the cream bottle from the pipette, and some butter makers find that it saves work in figuring, to carefully guage the dropping of the cream from the pipette so that they may stop it as soon as the scale shows just enough cream has been run into the bottle to exactly balance the weight desired. In this way the same amount of cream is weighed for each test.

This method of weighing the cream will be satisfactory provided the butter maker can split drops of cream or stop at just the point when he has a sufficient quantity to balance the weight. It requires some dexterity on the part of the butter maker to do this and unless he does it accurately there will be a trifle more cream in some bottles than others and the results will be correspondingly inaccurate.



The safest way for weighing cream, in my judgment, is to allow a certain quantity to run into the cream bottle on the scale and then accurately weigh it by means of a sliding indicator on the side bar of the cream scale. In this way you will be able to weigh each lot of cream accurately and this accuracy in weighing will help in getting exact results.

After the cream is weighed into the bottle, a sufficient amount of water is added to each one, so that the total volume of cream and water will amount to about 17.6 c. c; the acid is then added to the cream in the bottle and the test made in the usual way.

Reading the fat in the neck of the test bottle will not show at once the per cent of fat in the cream tested, unless you have weighed 18 grams of cream into the bottle in the first place. You will have to calculate the correct test of the cream from the reading. This is done by multiplying the reading by 18 and dividing the product by the weight of the cream taken. We will suppose that you weighed 4.75 grams of cream into a bottle and after the test was completed the fat in the neck read 5.2. The correct test of this cream may be found as follows: Multiply 4.75 by 18=85.5, which divided by 5.2 gives 16.44, the correct test of the cream.

Colonial Butter Salt

AND

Liberty Butter Salt

"MONEY MAKERS FOR BUTTER MAKERS"

Are freely credited, by the creameries who use them, with improving the quality of the butter over any other salt, being perfect in flavor, color, and purity, lighter and drier than any other, dissolving more quickly, preventing danger of streaked or mottled butter, while it is safe to work the butter less with these salts than with other makes. Regarding our two brands,

COLONIAL Butter Salt is a light, flaky grain, the lightest for the same bulk that there is on the market. While other makes use a barrel with but a 30 inch stave and a 19 or 20 inch head to hold 320 lbs., Colonial requires a barrel with a 34 inch stave and a 21 inch head to hold the same weight.

LIBERTY Butter Salt is granulated, every grain of the same size and perfectly square; contains one-tenth of one per cent. moisture, so it, as well as the Colonial brand, has the "make weight" feature. It is a little coarser in grain than any other granulated salt, which is a decided improvement, and because of its uniform grain it dissolves evenly and does not leave the butter gritty or mottled.

Send for Free Sack

of either or both these brands. Your request on a postal card will assure the prompt delivery to creameries and cheese factories only, without cost, a 56 lb. sack of either or both. Let us know your success with it after trial.

COLONIAL SALT COMPANY, AKRON, OHIO.

CHICAGO OFFICE.....84 ADAMS STREET

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

CONCERNING OUR ADVERTISERS.

THE NEW MANURE SPREADER.

Our readers will find elsewhere in this issue the initial announcement of the National Light Running Manure Spreader, made by Enterprise Wind Mill Co., of Sandwich, Ill. This is the latest machine of its class, and its makers claim has many important improvements over other makes. They promise a very handsome catalog which will be sent free to any reader who is interested in spreading manure by machinery. Address Enterprise Wind Mill Co., 107 Main St., Sandwich, Ill.

Don't force your cows to drink ice cold water. If you do the cows will not drink the water they need until driven to it by extreme thirst, and then drink the quantity of ice cold water that requires hours for the body to regain the normal condition of comfort. It is not simply a question as to whether you want more milk from your cows, but as well whether you want to warm that water with feed or wood. The Winona Tank Heater Co., of Winona, Minn., make an excellent heater for tanks. Their circulars you can get for a postal card. Mention HOARD'S DAIRYMAN.

AN INTERESTING DEVICE.

Among the many utensils for creamery users one of the interesting ones is the Taber Rotary Pump which occupies a unique field in the pumping world. It operates at slow speed and still does a maximum amount of work. Its extreme simplicity and the ease with which it is cleansed and kept in operation, makes it a device of which every dairyman should know. The Taber Pump Co., Swan St., Buffalo, N. Y., will be pleased to send their catalogue describing this pump free to interested parties.

FARM ECONOMY.

There is much heavy lifting and loading about the farm. In the case of hay, grain and litter, in handling the fork or the shovel at the best, there is call for mechanical help. The greatest relief to the burdensome toil about the barn and the field is found in the low metal wheel wagon with grooved tires. One-half of the effort in lifting and pitching is usually dispensed with. The manufacturers of the metal wheel with grooved tire, the Havana Metal Wheel Co., Havana, Ill., claim that for many purposes this is a stronger and more durable wheel than is afforded by the plain tire. They manufacture plain tire wheels for those who desire them, as well as low down wagons concerning which our readers would do well to write them.

Look for Marvin Smith Co's buggy advertisement in this paper. It's very attractive and they are making some very low prices. If you want a vehicle of any kind the advertisement will nterest you. We guarantee their responsibility.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Schmidt Treatment For Milk Fever.

Please give me, through your paper, the new treatment for milk fever from Denmark.

Grand Rapids, Mich. V. BROS.

ANSWER.

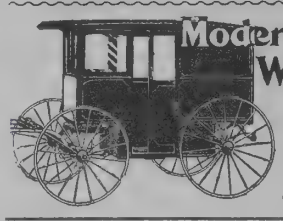
Dissolve 2½ drams of potassium iodide in a quart of water, which has been previously boiled, and keep the solution as nearly as you can the temperature of body blood. Then milk every drop of milk from the cow's udder, and clean with soap and water; when dried, disinfect the udder and teats with a solution of Zenoleum (1 teaspoonful to a pint of water). Then take a small glass funnel and attach to the same a rubber hose about 4 or 5 feet long, affix to the end of this hose an ordinary milking tube, insert the milking tube into the teat and slowly pour in your solution, dividing it equally between the four teats; when this is done apply massage to the entire udder for 5 or 10 minutes every hour, until the cow comes to her feet. Do not allow the calf to suck during the time the cow is being treated. If the cow is costive, remove the contents of rectum by hand. In case of a weak heart, small doses of aromatic spirits of ammonia may be given with water every hour; avoid large bulky doses of any kind, or your patient may suffocate from same. If your patient is not on her feet in 8 or 10 hours, the above dose may be repeated, but it is rarely necessary. This is practically the Schmidt treatment, and s almost a specific.

The writer has treated 167 cases of milk fever from Jan. 1st, 1903, to Jan. 1st, 1904, with the above treatment, out of which only 6 cases proved fatal and 161 made nice recoveries. It has been demonstrated to the veterinary profession that the potassium iodide in this treatment is not responsible for its success, but that the oxygen administered with the solution, deserved the credit.

We have therefore concluded to experiment with two cases in which the potassium iodide was entirely omitted, otherwise the above treatment was carried out to the letter, with the exception that a little more air was allowed to enter the udder while injecting. Both of these cases recovered and are giving their usual flow of milk.

Pure oxygen is being used with good results in the treatment of milk fever, but if it can be administered with the water in the form of air as above demonstrated. It is surely cheaper and always at hand.

Abscesses in Udder.



We tried the remedy prescribed by you, viz—iodine resub, 1 oz.; lanolin, 16 oz.; applied warm, rubbed on well twice daily and acetate of potash, 1 oz.; fl ex poke root, ½ oz., in 1 qt. warm twice daily.

The udder has been softened considerably by the treatment but the udder has broken in three places one after the other at intervals of about one week. These three abscesses have been, two on the right side and one on the under side of right half. Left hal fof udder is partly in normal state now but right half seems quite diseased yet and the udder is now swelled moderately hard near top of udder on back of it. We are trying to reduce it by rubbing well with the lanolin ointment and are continuing the liquid drench twice a day as directed. J. M.

ILLUSTRATION

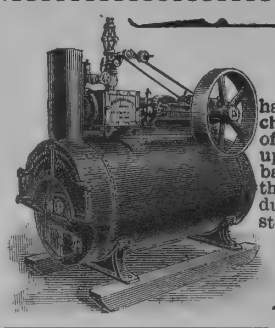
PLANET JR. NO. 4 ILLUSTRATED.

We are giving place here to an illustration of the Planet Jr. No. 4 Combined Drill, perhaps the most popular of all the famous Planet Jr. line of garden tools. We call it Drill for brevity, but it is much more comprehensive. The gardener finds in it almost every tool for hand work he needs. As a seeder, it drills and also plants in hills with greatest accuracy, and it may be set so that they shall be 4, 6, 8, 12 or 24 inches apart, as desired. It is but the work of a moment to remove seeder attachments and substitute the pair of hoes, the three hollow steel teeth or the plow, and you have an ideal wheel hoe, cultivator or plow, as the case may be. Its handles adjust to suit either man or boy. Simply raising the handles cuts off the flow of seeds instantly. As a hoe or cultivator, it may be used either in the furrow or, by means of an extension piece, when the plants are small you may hoe or cultivate both sides of the row at once. With all its width of duty, it is most simple and it is most durably built. An idea of its real genius cannot be conveyed in so small a space as this. It is advertised elsewhere. S. L. Allen & Co., of Philadelphia, the manufacturers, will gladly send catalog fully describing. It is a good investment to send a postal for it.

WE HAVE THE DROP.

In accuracy, certainty, evenness and durability, no other planter can compare with

The AVERY.



Combined Hill and Drill Drop. Cannot Miss Hills.

Take no chances on the corn crop. New-fangled Drops, adopted in the hope of approaching the efficiency of the old reliable Avery, may work well and make a showing with selected grains of corn, but reliable work in the field is what counts. They will be effective only as they approach the Avery principle, the type which all others would emulate. Adjustable in width, all modern improvements. Six styles of Cultivators; Farm Wagons, Stalk Cutters, etc. All high grade. Nothing better made.

Will save one-third of feed, and make stock thrive better. To introduce, one at wholesale price where we have no agents. Prices and Catalog "D" free.

R. R. Howell & Co. Box H, Minneapolis, Minn.

ILLUSTRATION

We illustrate herewith the Witte Stationary Engine, made in sizes from 1½ to 40 actual horse power, particularly adapted to our readers' trade. The engine is well put up, is a very simple compact machine, well proportioned, and has a cylinder separate from the bed, just like a high grade steam engine. The company also makes a very desirable Portable Engine, for farm use, in sizes from 1½ to 25 actual horse power. During the year 1903 they put out a large number of these Portables, which are giving most excellent satisfaction, as they can be used not only on the farm, but on every neighbors', and the farmer can move it about where his work is to be done. The company makes a guarantee also, which shows how accurately the work is done, and how carefully and systematically the engine is balanced. The guarantee, in addition to the one of full horse power, and durability for five years, is, that no Portable engine will vibrate more than one-eighth inch endwise on a smooth wood floor, with no blocking for the wheels. This shows to what perfection it is possible to get a high grade machine, and it speaks well for the quality of work put into all of their engines. If our readers are interested, we recommend that they address the Witte Iron Works Co., Kansas City, Mo., or the Witte Gas & Gasoline Engine Co., Chicago, Ill., for catalogue of either the Stationary or Portable engine.

Marysville, Ont., Dec. 14, 1903.
The Troy Chemical Co., Troy, N. Y.
Gentlemen:—My horse was affected with a thoroughpin which rendered her almost useless, although a valuable animal being one of a matched pair of roadsters. It was about the size of a goose-egg both inside and outside of the leg. I tried some of our best veterinary skill as well as different blistering medicines with no effect. I worked with it for about one year. Being a subscriber to the "Country Gentlemen" I saw your advertisement in it and determined to try it as a last resort as I was discouraged with everything else. When I had used the first bottle I saw a change. This encouraged me and I kept at it and completed a cure. I have no hesitation in saying that I believe "Save-the-Horse" is the best, and would advise all who have a horse so affected to use nothing but "Save-the-Horse". I give you permission to use my name. Yours truly J. G. ALLISON.

Columbus Grove, Ohio, Dec. 21, 1903.
One-third of a bottle of "Save-the-Horse" cured my horse of a spavin that had been fired and blistered several times in the past two years. M. M. OSBORN.

Califon, N. J.
Less than two bottles "Save-the-Horse" made a perfect cure on my horse that was affected with hip joint lameness. ADAM LANCE.

No man need see his horse suffer and become incapacitated. "SAVE-THE-HORSE" POSITIVELY AND PERMANENTLY CURES BONE AND BOG SPAVIN, THOROUGHPIN, RINGBONE (except low ringbone) CURB, SPLINT, CAPPED HOCK, WINDPUFF, SHOE BOIL, WEAK AND SPRAINED TENDONS AND ALL LAMENESS. Apply in all extremes of weather. Cures without scar or blemish or loss of hair Horses may work as usual.

$5.00 per bottle. Written guarantee with every bottle. Constructed solely to protect you. Need of second bottle improbable, except in rarest cases. Copy of booklet and guarantee sent upon application.
$5.00, at druggists and dealers or sent express paid by

1¼ lbs. with an ounce or two of ginger in two quarts of warm water as a drench.

The abscesses may be opened with a sharp, clean knife and washed with an antiseptic solution. Hot applications to the swollen parts in addition to your ointment are indicated to hasten the maturity of abscesses.

Erythema.

A colt, about Dec. 1st, swelled a little in the pastern joint of the right hind foot. The swelling was very hot, feverish and the animal could hardly walk. I doctored it with liniment; it left that foot and settled in the right front foot: I treated that the same; it went to the left front foot where I can do nothing with it. Now it has got in both front feet and the beast can hardly get around. The pastern joint seems to be the place; it is swollen and very feverish. F. H. H.
Brady, Neb.

ANSWER.

Your colt has a chronic attack of erythema. Give a pill of the following: aloes, 7 drs.; zingiberis, powdered, 2 drs.; nux vomica, powdered, 1 dr. Mix and make 1 pill. Give at once. Then follow with potassia nitrate, 2 oz.; quinine sulphate, ½ oz.; gentian root, pulverized, 2 oz. Mix and give a large teaspoonful in food three times daily.

Poultice the foot so affected with warm linseed twice daily for four or five days, then wash twice daily with a solution of sugar of lead, taking 1 ounce to the pint of rain water. If in a week, the swelling appears again and the inflammation sets in, the poultice may be repeated, also the pill may be repeated by this time.

Failure to Breed.

I have 3 cows that have been served 3 or 4 times since calving. One calved June 4th, the other Sept. 24th, last Oct. 4th. What shall I do to make them breed?

The cow that calved Oct. 4, on Oct. 7 cut her front teat on right side on barbed wire fence. Since it healed there is a lump between the teats, and she gives very little milk out of that half of udder. Sometimes it is swollen in one quarter and then the other, and milk is lumpy whenever it swells. W. B. L.
Irby, Va.

ANSWER.

It is advisable to change bulls in such a case and try them again. A change of environment would aid in bringing them to a breeding condition.

The lump between the teats appears to be a fistulous nature and may be the cause of the swelling and altered condition of the milk. We would advise to have same examined by a qualified veterinarian and removed if necessary. If this is successfully done, she may be as good as ever after the next freshening.

An Absorbing Ointment.

In number 42, page 955 you give a prescription as follows: Iodine resublimed, 2 ozs.; potassi iodi, 1 oz.; petroletum, 8 ozs., for the treatment of a soft bunch on the knee of a horse. Is it necessary to form a blister in order to effect a cure? J. H. W.
Freehold, N. J.

ANSWER.

The above ointment will absorb the bunch, but will not act as a blister, though it may slightly erupt the skin. Apply it as directed and there will be no injurious after affects of any kind.

Warts on Teats.

I have a cow that is continually afflicted with warts on her teats. They grow anywhere on the teat, sometimes so near the orifice as to interfere with the free passage of the milk.
Glenfield, Pa. H. P. H.

ANSWER.

Clip them off with a pair of sharp scissors and touch the parts lightly with a stick of lunar caustic. Clip them as closely as possible.

The Price of Butter.

The price of butter has ruled higher throughout the country during 1903 than in any recent year. The question is being discussed in the Eastern press as to how far this increase in the price of butter is to be attributed to the Federal oleo law. The subject is discussed as follows in the Philadelphia *Grocery World*:

The Federal Oleo Act of 1901, under which colored oleo is taxed 10 cents per pound, has undoubtedly been a godsend to the butter market for the last year at least. For the practical elimination of oleo as a competitor of butter has enabled the butter people, in a year of tremendous production, to keep their prices up several cents above what they would have been with colored oleo freely in the market.

The make of butter has been enormous for the last two years, and there has been some glut, but nothing like what would have come had the sale of oleo been unrestricted. As a matter of fact, the price of butter for the last two years has been so much above the price of other exporting countries that American butter has had no export outlet, and this has naturally increased the domestic supply.

These high prices have not been wholly caused by the elimination of oleo, as one direct factor has been the high price of milk, caused by the demand from the condensaries. The falling off in the sale of oleo, however, has unquestionably had much to do with it.

The recent Federal act and other causes have greatly changed the complexion of the butter market in the last two years. In the large cities a great horde of peddlers who formerly sold oleo are now forced to sell butter. They are after the cheaper grades, and this has caused activity in those.

Another change which is worthy of note is the decrease in the production of dairy butter, which is the sort of butter made by farmers and turned into the country stores to be sold. The concerns that sell separators have placed them in rural districts all over the country. With a cream separator the farmer no longer turns his cream into butter, but separates it and ships it away to some creamery. This in turn has caused a local demand for creamery butter, since there was little or no dairy butter, and a large number of creameries are not shipping to large markets, but are disposing of their production locally. Dairy butter, it is to be said, invariably sold cheaper than fine creamery, and the absence of it also strengthens the creamery market.

To come back to the effects of the oleo law, the prices of butter would have almost surely been lower had the act referred to not been passed. As it is, the heavy production forced prices to a point two or three cents lower than a year ago, but a plane lower yet—probably much lower yet—would have been reached had the enormous make of butter had to compete with the usual quantity of yellow oleo.

The butter market last June was higher than supply and demand would have made it, but this was by reason of speculation and the fact that the season was three weeks late. Since June, however, the conditions have been more normal, and prices have kept a lower level.

The make of butter was so heavy last summer that there is an enormous quantity of butter in cold storage which will have to be consumed sometime. There was also large storings in June, but at such a high price that the present market will not allow it to be withdrawn.

HOMES FOR EVERYBODY IN Oneida and Vilas Counties, WISCONSIN.

Do You Want a Farm?

A Farm here at home,
Where Rain falls,
Where Crops are Sure,
Where Water is Pure and Plenty,
Where Fuel is Cheap and Abundant,
Where Railroads Run and Good MARKETS are NEAR, and
Where Prices are Easily Within Your Reach?

If you want a farm it is not necessary to leave your friends and go a thousand miles away to find it. It can be found right at home.

On the head waters of the Wisconsin river, in Oneida and Vilas counties, Wisconsin, are lands of rich soil of the very best crop producing qualities, belted by the best railroads in the northwest, bountifully watered and wooded, safe from drouth, and offered at prices not a shade higher than those asked for lands in dry, distant and unimproved sections.

Buy You a Ticket to CROOKSTON, MINN., and call upon
The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $36.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

HOW TO TEST COILED SPRING WIRE.

Take a piece of No. 12 wire and coil it firmly around an inch rod of iron, as shown in figures 1 or 2. Try to pull the coil out of it. You may think you have done so, but upon releasing, it will assume shape shown in figure 3. Then look along the wire as you would a gun barrel; it will appear as shown in figure 4—has the appearance of a tube. This explains the great advantage of **COILED SPRING WIRE** and how it provides for contraction and expansion.

The weave of our fence is so perfect that full strength of every wire is preserved. Every twist is an expression of strength. Good enough to last a lifetime. We make it

HORSE HIGH, BULL STRONG, PIG AND CHICKEN TIGHT,

Using only High Carbon Heavily Galvanized Coiled Spring Steel Wire; to get this good enough we make it ourselves. Best wire makes the best fence. We ship any style of fence we make

Buff Jersey Visits the St. Louis Fair Grounds.

ED. HOARD'S DAIRYMAN:—On the 8th of the month I had the pleasure of visiting the fair grounds at St. Louis. I found that the work yet to do, in the time that it ought to be done, is very great and I do not see how it will be completed. I was told that the work would be carried on both day and night as soon as the frost was out of the ground. The vastness of the undertaking strikes one more forcibly in the uncompleted buildings than it perhaps would if everything was completed. I was very much interested in the methods used by the foreign countries in constructing their buildings. They used the native woods and tools and the methods of construction were of interest to me.

I was more interested in the Jersey cattle and the barns than any other thing, and, I might add, disappointed as well. The cows were taken to the grounds on the 19th of December and appear quite content. The barn for them is not a model one, and any one who may go to see them and expects to get some ideas of what a modern dairy barn should look like, will be disappointed. He will not even see a model stall, tie, or any other up-to-date appliance that many progressive dairymen are using all over the United States. He will see the silo at a distance from the barn and the contents carried to the cows by the attendants, when it should have been so situated that it would have been delivered directly into the barn. He will see (I did at least) a barn with no sewer connections, and the floor on an incline so that the water in gutters ran to lower side of the room and overflowing the gutters ran over the walk behind the cows. He will find that the cows and attendants are on the same level, all occupy the same room. The milk and all milk vessels are in same room with the cows, together with the boiler that is used to heat the room and grind the feeds, but I will not tell of any other things lacking. Will only say that the Club submitted plans for a model barn and got turned down, and they are not the only ones that were turned down, so may get a little comfort from that.

Extortion will be the order on the opening of the fair, and for that matter it is the chief feature at the present time. A friend of mine put up at a hotel in St. Louis some days ago and was charged $4.00 for his room and 85 cents for breakfast. Another man that has to be in the city during the Fair, was asked $90, for an 8-roomed house, per month. The understanding is, that rooms in houses about the city will cost two persons $1.00 each per night and meals $1.00, making $4.00 per day, and we will be lucky if we get away with no worse luck.

The past week I was a visitor at the Agricultural College at Ames, Iowa, and had the pleasure of seeing the work that is making this institution so popular; Prof. McKay's department was of the greatest interest to me. On the day I arrived at the College the dairy school had concluded some experiments along the line of treating over ripe cream so that it could be ripened with a prepared starter and be made into a good butter. The acid was neutralized with some form of alkali and then a starter was put in the cream from which butter that scored as high as 93 points was made. This method will be a great benefit to the creameries that are getting their cream from long distances.

I was much surprised to learn that the college has not paid much attention to the production of milk, but has given butter making the right of way, while the cow has had to stand back for the steer. Now there is a demand for the cow to be given a place, and I was told that an appropriation would be asked for to buy a farm and cows so that the students might study milk production from the standpoint of the farm and its surroundings. In other words, the milk will be produced in a business manner, with a view of profit, not as some of our stations are doing, keeping a $40 cow in a $10,000 barn to teach the farmer's son profitable dairying.

I had the pleasure of addressing the corn judging school at two sessions and the attention given me was very flattering; my talks were along the lines of saving the stalks as well as the ears.

On the 14th of the month, I was at the dairymen's convention of this state and had for my theme "some of our cows" records and feeds required." I had figures that showed that of the 28 cows and heifers that have freshened for the second time in our herd, not one of them have given in past year less than 5,000 pounds of milk and at no time in the year has the test gone below 5%; one cow gave over 9,000 pounds of 5.2% milk and several passed the 7,000 pound mark; and at no time have any of these cows received over 10 pounds of grain per day. It was stated by some of the dairymen present that they were feeding 20 pounds of grain daily. I cannot see how they can do so and have their cows in good health.

Milk fever is another thing that I do not see the use of having. In the past few weeks we have had 20 cows freshen, as many as four in a week, and in one case twins and not a cow off feed; good enough to have the fever did you say? Well, yes. Trilby, the best 2 year-old I ever developed, 400 pounds of butter in one year as a two-year-old, gave us the twins, and in her three-year-old form, gave 40 pounds of milk in a day, and others have freshened that have records of six and seven thousand pounds of milk yearly. I do not for a moment doubt my ability to bring any cow to the milk barn through the freshening period, sound and hungry, and any one can do the same if they only will. BUFF JERSEY.

Monmouth, Ill.

Agricultural Education in Iowa.

ED. HOARD'S DAIRYMAN:—Taking in the short course in agriculture, at the Ames College, Iowa, Jan. 4-16, some things as regards the dairy interests more particularly came to my notice. According to the Iowa dairy statistics there is something radically wrong with that industry in that state. It is unusual to see a flourishing industry degenerate, but such is the fact there as shown by their statistics.

What is the cause? It surely ought not to be the officials at the college who are so wrapped up with the beef breeds, and therefore, though indirectly and unintentionally, hit the dairy business for which that grand old state had such representation, heretofore. Then, too, it is my sincere belief that the dual-purpose cow idea, which has been so much talked about in Iowa, perhaps more than any where else, is responsible for the present condition.

Dairy Commissioner Wright and his able assistant, Prof. Keifer are doing everything possible in their power to foster the industry, but it is very apparent that the seed of dual-purpose ideas was sown long previous to their efforts. Then, too, human nature seems to be the same everywhere; most farmers have made their success, as everywhere else, in the dairy business, and when

SALZER'S SEEDS

Mr. Farmer
If Mr. Salzer, whose lifetime has been spent in improving and increasing the yields of farm crops, can prove to your entire satisfaction, that where you now grow 40 bu. of Oats, Salzer's sorts will give you 100; where you take off 50 bu. of Corn, Salzer's sorts will make it 120, and on Barley doubles, on Wheat triples your yield, and on Potatoes gives 736 bu. per acre, as found below, would you then try Salzer's Seeds? Well, Sir, we can prove and convince you positively if you will read Salzer's catalog.

Salzer's New National Oats.
Greatest Oats of the century. Salzer's Oats has the endorsement of the U. S. Dept. of Agriculture as the very best out of over 400 sorts tried by them. Ever other sort must take the back seat.

187 Bu. per Acre.
S. Hyde, Ashland Co., O., says: "Your National Oats yielded for me at the rate of 187 bu. per acre."

231 Bu. per Acre.
L. Schiestel, Osceola Co., Mich., says: "I never saw anything like Salzer's National Oats. It yielded for me 231 bu. per acre."

255 Bu. per Acre.
H. E. Nye, St. Louis Co., Mo. "Your National Oats was a sight worth seeing—4 ft. tall, a solid stiff mass, not a stem lodged, yielded over 255 bu. per acre for me!"

310 Bu. per Acre.
M. E. Ursner, Ransom Co., N. D. "Salzer's National Oats is great. It made the astonishing yield of 310 bu. per acre!"

Now Mr. Farmer
Your land is just as good, and you are surely just as good a farmer, will you not beat this Oat record in 1904?

Speltz or Emmer,
80 Bu. per Acre.
Wonderful Speltz, marvelous Speltz, profitable Speltz, the farmer's firm friend, flourishing everywhere and yielding 80 bu. of grain and 4 tons of splendid straw hay per acre besides.

Home Builder Corn.
Was named because 50 acres in 1902 produced so bountifully that it built and paid for a beautiful home. See Salzer's catalog. It is the biggest eared early and heaviest yielding Yellow Dent Corn we know.

Billion Dollar Grass and Teosinte.
A noble pair. Billion Dollar Grass, the most talked of grass on earth, makes 14 tons of fine hay per acre, while Teosinte astonishes and startles you with 80 tons of green food per acre, rich in sugar and milk and food values.

Potatoes—736 Bu. per Acre.
The Editor of the Rural New Yorker proclaims to the world that Salzer's Early Wisconsin Potato yielded for him 736 bu. per acre, and we have several sorts that will beat that record.

Farmer, Attention! Fall of 1904 Potatoes may be worth 60c a bu., then 10 acres at 736 bu. per acre would mean $4,416.00 and you can pocket that money, if you plant Salzer's Potatoes.

For 10 cents in Stamps
and the name of this paper, we will send you a lot of farm seed samples, including some of the above, fully worth $10.00 to get a start, together with our mammoth 140 page illustrated catalog, well worth $100.00 to each and every wide awake gardener and farmer. All this we send for but 10c in postage stamps.

ALNEER BROS., No. 82 A BLK, Rockford, Ill.

Burpee's Seeds, Philadelphia

A postal addressed as above will bring you Burpee's Farm Annual for 1904,—if you intend to buy Burpee's Seeds,—otherwise the price is ten cents, which is less than cost per copy in quarter-million editions. It is an elegant book of 178 pages, with Six Superb colored plates; tells the plain truth about the Best Seeds that Grow. Better write TO-DAY! Do not Delay!

their circumstances became such, and relaxed effort is the rule, and not the exception, the inevitable followed.

After attaining financial success, a great many were carried away because of their success, by the intoxication of success, and now find themselves sobered by disastrous failure in feeding cattle and dual-purpose hum-drum.

I have it from the best of authority that many farmers have even mortgaged their growing crops for money to buy feeders to feed the mortgaged growing corn to and are now selling the unfinished animals for about what they cost them to put in the feed lot. However, they have seen the error of their way and will return to producing milk.

Does it need financial ruin before we can realize how to let well enough alone?

Do we have to emulate the Prodigal of old to wake up to realize our best interests?

Oh, yes, we all would like to live on Easy street, but there is danger in the allurement. The used ploughshare will be bright and perhaps last longer than the rusting and unused one, but better wear out than rust out.

This is what has been done in Iowa. It also holds true everywhere else. Dairying to the younger generation, and some of the older ones too, became too confining, wanted an easy time, and found it easy sliding to the bottom. However, the spirit of these energetic people is not broken. With renewed vigor will they take up the task and profit by the experience.

When the officials at Ames also will work as persistently to enthuse their people in the dairy interests as they have done in corn growing and beef cattle judging they can then truly say "Eureka," and, by far, distance all competition. The Iowa people evidently understand the situation. I am informed of their intention of establishing a dairy herd at the College, of one hundred cows for experimenting purposes.

As usual, Prof. McKay has a large class in butter making, post graduates, many coming from other states. The Professor's reputation as a manipulator of cream is too well known in this and other countries to need special mention. He again has gone a step ahead in butter making which will mean much to the dairy interests.

The much talked of overrun has always been a contention among butter makers and the legality of which was shaped by the government enacting a law specifying 16% moisture. The Professor has found that a 25% overrun can be made and still be within the law. The explanation is so intelligently and clearly given that, like many other discoveries, we have to exclaim why hasn't it been thought of before. No doubt the Professor will, in the near future, give his investigation to the public.

The ever vigilant butter maker from Sioux City, Iows, Mr. Mortensen, was also present. He is an example of what an energetic young foreigner can and will accomplish when given an opportunity. He came to the Iowa dairy school a few years ago a poor boy, working his way through the four year's course. Today he is the head butter maker for one of the largest creameries in the country, making fifteen tons of butter per day during the best part of the season, and is so valuable to them that he don't envy the salary of a Congressman.

The prejudice against the Hand Separator Creamery System is growing beautifully less.

In Iowa, as most everywhere else, they hold to the Missourian plan: "Show me." Not only have they the example of Nebraska and Kansas where all that would pass muster, and the general results as satisfactory.

Of course this is an age of new discoveries, and no doubt McKay's idea will have a "run" until it dies a natural death. J. F. S.

Farmers' Institutes in Georgia.

ED. HOARD'S DAIRYMAN:—The first year of the Farmers' Institute system in Georgia has just closed, with a meeting held at Fayetteville, Fayette County, Ga., on Saturday December 19. Prior to the year 1903 only a small amount of work along the line of Farmers' Institute has been attempted in Georgia. The present year has, however, witnessed a new awakening, and very successful meetings have been held throughout the entire state. The expense of the work has

$24.75 buys our "Duchess" top buggy, exactly as shown in cut, with top, curtains, shafts, anti-rattler, cushions nicely trimmed. Best value ever offered. If you want a vehicle of any kind, write at once for our vehicle catalog.

"ADVERTISEMENT."

For Singers and Speakers.

The New Remedy for Catarrh is Very Valuable.

A Grand Rapids gentleman who represents a prominent manufacturing concern and travels through central and southern Michigan, relates the following regarding the new catarrh cure, he says:

"After suffering from catarrh of the head, throat and stomach for several years, I heard of Stuart's Catarrh Tablets quite accidently and like everything else I immediately bought a package and was decidedly surprised at the immediate relief it afforded me and still more to find a complete cure after several weeks' use.

"I have a little son who sings in a boys' choir in one of our prominent churches, and he is greatly troubled with hoarseness and throat weakness, and on my return home from a trip I gave him a few of the tablets one Sunday morning when he had complained of hoarseness. He was delighted with their effect, removing all huskiness in a few minutes and making the voice clear and strong.

"As the tablets are very pleasant to the taste, I had no difficulty in persuading him to use them regularly.

"Our family physician told us they were an antiseptic preparation of undoubted merit and that he himself had no hesitation in using and recommending Stuart's Catarrh Tablets for any form of catarrh.

"I have since met many public speakers and professional singers who used them constantly. A prominent Detroit lawyer told me that Stuart's Catarrh Tablets kept his throat in fine shape during the most trying weather, and that he had long since discarded the use of cheap lozenges and troches on the advise of his physician that they contained so much tolu, potash and opium as to render their use a danger to health."

Stuart's Catarrh Tablets are large pleasant tasting lozenges composed of catarrhal antiseptics, like Red Gum, Blood Root, etc., and sold by druggists everywhere at 50 cents for full treatment.

They act upon the blood and mucous membrane and their composition and remarkable success has won the approval of physicians, as well as thousands of sufferers from nasal catarrh, throat troubles and catarrh of the stomach.

A little book on treatment of catarrh mailed free by addressing F. A. Stuart Co., Marshall, Mich.

SAFE IN THE WIND

A lantern that blows out is but little better than none. There's no necessity of having that kind. There are lanterns that don't blow out.

DIETZ
Cold Blast
LANTERNS

are the kind and they beat all others in the clear, white, steady light they shed. Then there's the safety and convenience where Dietz Lanterns shine. Safety is absolute. You never remove the globe to light, extinguish, trim or fill. Sold the world over by dealers. Before you go to buy write for lantern book and make your choice.

R. E. DIETZ COMPANY,
94 Laight St., New York.
Established 1840.

been borne by the University of Georgia, through an appropriation of $1,000 set aside for this purpose by the trustees early in Jan. Hon. Harvie Jordan, of Monticello, was selected by the Trustees as Director of Institutes. Col. Jordan is at the head of the Southern Cotton Growers' Protective Association, is a member of the state Senate from the 8th district, and was recently elected president of the National Farmers' Congress at their Niagara Falls meeting. He has been editor and contributor for the best agricultural Journals in the South, and is a well informed speaker who commands the attention and confidence of the farmers wherever he goes. During the year just closed, Director Jordan has held 44 institutes in all, one in each senatorial district of the state. One object of the first year's work was to organize the institute system thoroughly, and with this in view a president and secretary, were elected for each district, by the institute audience, and also a vice president from each county in the district. The interest and attendance at the meetings have been quite remarkable, considering the fact that the work was new and not so thoroughly understood by the farmers generally.

The average attendance has been between 150 and 200 at a meeting. The sessions have been held only one day at a place The news papers have helped most cordially in the work, with notices and printed programs. The average number of lectures delivered at each institute was five, and the average number of speakers present was three. Director Jordan had the help of many prominent agricultural workers at various times during the year. President H. C. White, Dr. J. S. Stewart and Prof. J. M. Johnson represented the Georgia State College of Agriculture at various meetings.

Director R. J. Redding of the Georgia Experiment Station, and Professors H. N. Starnes horticulturist, C. L. Willoughby, dairyman and J. M. Kimbrough, agriculturist, attended many institutes to lecture on their specialties.

Hon. D. M. Hughes, president of the Georgia Agricultural Society, assisted materially with many meetings. Messrs. E. A. Ross and W. L. Glessner, of the Industrial departments of the Central of Georgia and Southern & Fla. Railways, gave special lectures, and special local talent was secured at all times available.

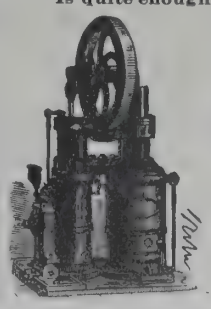
The principal topics discussed during the work have been: Agricultural Education, Corn and Cotton Culture, Fertilizers and their Use, Forage Crops and Grasses, Business Methods for the Farmer, Value of State and County Fairs, Fruit & Vegetable Culture, Breeding and Feeding of Beef and Dairy Cattle, Pork Production, Improvement of Farm Homes, etc.

Director Jordan will soon issue for distribution a bulletin on this work, giving records of the meetings held and the officers elected at each place and a compilaton of the most important lectures delivered during the year.

For the year 1904 it is hoped that provision will be made to hold one institute in each county of the state, and continue the session for two days in each place. Every section visited has shown considerable interest in the work, after fully understanding its objects and purposes, and all persons attending seemed desirous that the meetings be made permanent features of the state's educational system in the future. Considering the ready and hearty response of the farmers, the institute work, if properly supported, will doubtless reach a high state of usefulness in Georgia in a much shorter time than has been required in other sections.

C. L. WILLOUGHBY.
Georgia Experiment Station.

Handling Manure.



ED. HOARD'S DAIRYMAN:—I am very much interested in an article written by E. M. H. appearing in your issue of January 1st. While I like his plan and think it a good one for a hillside barn, I fail, however, to see where the advantage comes in with solid manure with a stable situated on a level spot.

The never ending, dreaded, back breaking task he mentions, seems to me to be increased rather than diminished by dropping solid manure into a cistern, unless he has some other labor saving invention (which he does not here mention) for lifting this manure onto a cart.

Now, Mr. Editor will you kindly put me in communication with E. M. H. or publish this letter for the benefit of such of your readers who like myself, are in the dark on this point, as well as to get an explanation from E. M. H. J. W.
Duncans, B. C.

ANY FARMER CAN START

a welding fire in two minutes in our **FARMER'S FORGES** and do his repairing and blacksmithing at home.

WE GUARANTEE our **FARMER'S FORGE** to be as large and do as much work as any $10 Forge made, and as represented or refund your money.

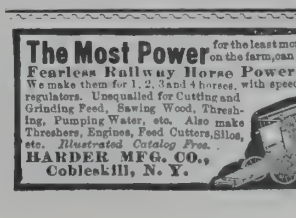
Extracts From Recent Testimonials:

"The Forge I purchased of you six years ago has always given perfect satisfaction." THOS. BLAKELY, Leslie, Mich.

"The Farmer's Forge ordered of you in 1899 is still in perfect order and I am well satisfied with it." J. W. FOUNTAIN, Branchville, N. J.

"It has proved more satisfactory than one of the all steel Forges that one of my neighbors has." S. DRAKE, Hicks, N. Y.

"It is the best article for the money that I ever saw or used. It caps the forge climax." E. LEWIS, Middletown Springs, Vt.



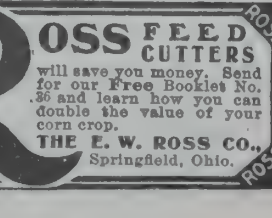
SPECIAL OFFER Regular price o fforge is **$5,** but until March 31, 1904, we offer the **FARMER'S FORGE,** complete, ready for use, for **$3.75** each, or a Farmer's Forge, complete, an anvil and vise combined and a pair of tongs, all for **$6.50.** This offer may not appear again. Write today sending stamp for catalogue and testimonials.

C. A. S. FORGE WORKS, Saranac, Mich.

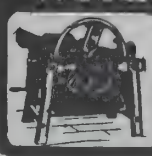
Planet Jr. Companion Tools.

No. 3 Planet Jr. **Hill and Drill Seeder,** shown on the right, holds its position as the tool for perfect hand seeding. Converted in an instant from drill to hill planter and back again. Drops in hills 4, 6, 8, 12 or 24 inches apart. It opens the furrow, drops the seed, covers it different depths, rolls down and marks the next row. With this tool any novice can plant all garden seeds at the speed of a walk and with great accuracy.

No. 12 Planet Jr. **Double wheel Hoe** is the companion tool for the No. 3 Seeder. The plant is never too small nor too large for it to work perfectly. Quickly adjusted to suit wide or narrow rows, to suit man or boy, to work astride plants of any height up to 20 inches, or between them. Kills weeds, hoes, cultivates, furrows, ridges, and throws earth to or from plants as desired.



Planet Jr. 1904 Catalogue



shows forty different machines, including Seeders, Single and Double Wheel Hoes, Hand, One and Two Horse Cultivators, Horse Hoes, Beet Sugar Cultivators, etc. Over 100 illustrations, including 16 beautiful half tones of home and foreign farm and garden scenes. Mailed free to all.

Made for the Man Who Wants the Best

GREAT WESTERN ENDLESS APRON Manure Spreader

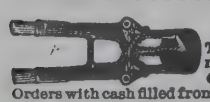
Spreads all kinds of manure regardless of their condition, handles barnyard manure that has been tramped so hard that it is necessary to loosen with pick, fresh stable manure, containing wet or dry straw, corn stalks, etc. Old straw stack bottoms, whether rotted or not. Cow manure fresh from the gutter, sheep manure, lime, salt, ashes, and in fact all kinds of manure and fertilizers and does it quicker, better and more evenly than by hand. Spreads as much manure in one day as 15 men can by hand. Spreads the largest load in 2 to 4 minutes. Makes the same amount of manure go three times as far and produce better results. Will pay for itself the first season. Every machine has our

Non-Bunchable Rake which forms a hopper and holds all hard chunks of manure in contact with beater until thoroughly pulverized before discharging, therefore no bunching or uneven work. No burning from an overdose of manure in spots. The

Endless Apron is one continuous apron (Not a ½ apron) and therefore is always ready to load, no turning back into position with crank or reverse gears to cause breakage. Can be heaped up half way if desired. Apron does not extend below axle. The combined

Hood and End Gate keeps manure away from beater while loading, prevents choking of beater when starting and acts as a hood and wind shield in spreading. Starts the manure in the right direction, therefore spreads more evenly.

Feeds Thin or Thick. It has a graduating lever and can be changed to spread thick or thin, 3 to 25 loads per acre while in motion. It catches the poor spots with a double dose.



Light Draft. 1st. Because the load is nearly equally balanced on front and rear wheels. 2nd. The team is as near load as it can work. 3rd. Front and rear axles are same length and wheels track. 4th. Beater shaft runs in a **ball and socket bearing**, therefore no friction. **Beater is 23** inches in diameter. Shipper **positively** throws machine into and out of gear and holds it there. **Seat** turns over when loading. Machine turns in its own length.

Strength and Durability. Our machine is made so strong that it is almost impossible to break it. Every piece is made extra strong regardless of cost. Every gear and sprocket wheel is keyed on. We use no pins or cheap contrivances to come loose, get out of order, break and cause trouble. Our guarantee covers this point fully.

Guarantee. Should any part break, wear out, or get out of order within one year, we replace free of charge upon notice.

Large Catalog, 10 by 13 inches, with 8 large cuts shows spreader perfectly and describes it fully. Gives 34 reasons why the **Great Western Endless Apron Manure Spreader** is the best and most complete machine made and why you should have one. Also tells how to apply manure to secure best results. **Mailed free.** Write for copy today.

SMITH MANURE SPREADER CO., 16 & 18 S. Clinton St., Chicago, Ill.

IT PAYS TO DEHORN. Hornless cows give more milk. Hornless steers make better beef. The best dehorner, the most humane and easiest to use is the **Keystone Dehorning Knife** Cuts on four sides at once, without crushing or bruising. Highest award at world's fair. The Farrington Duplex Pasteurizer.

Built Entirely of Metal
Among the users of our Farrington Duplex Pasteurizers we have the names of the leading milk companies of the country.
The Farrington is not a Summer or Winter machine, but equally satisfactory at all seasons of the year. For convenience, durability, thoroughness of work and economy it leads them all. We are prepared to prove it. Write for further information.
CREAMERY PACKAGE MFG. COMPANY
General Agents Alpha-De Laval Separators.
Branches: Kansas City, Mo.; Minneapolis, Minn.; Waterloo, Ia.; Omaha, Neb. and Cowansville, Quebec. New England Agents: Stoddard Mfg. Co., Rutland, Vt. Pacific Coast Agents: De Laval Dairy Supply Co., San Francisco, Cal.
182 to 188 East Kenzie St., Chicago.

The ROCKER CHURN
Gets the butter from the cream down to the one thousandth part. Made of tasteless wood and the churning process is entirely the result of its own motion—no machinery inside or out to get out of order or require oiling.
Its Special Advantages
are: 1—Simplicity. 2—Least friction. 3—Gravity does the churning; a child can operate it. 4—Absolutely no adjustments, always ready. 5—Nothing but the churn box to clean, easily accessible. 6—Violent agitation of cream without paddles or dashers. 7—Gives the finest grade of butter of any churn on the market. WE PAY THE FREIGHT.
Your money back if not satisfied. In eight convenient sizes, 8 to 60 gallons. Price as right as the quality. Illustrated circulars free.
Rocker Churn Mfg. Company, Forsyth, Georgia.

TUBULAR SEPARATORS ARE AS ADVERTISED.

By constant advertising we keep you informed of the good points about Tubular Cream Separators. **Because they are entirely different** from all others we have more to tell than any other cream separator makers.

We tell you about the train loads of Tubular Separators we ship so you'll know the great number being sold. **We tell you of the many contests Tubulars win** so you'll know the fine work they do.

We explain the construction of Tubular Separators so you'll understand how different they are from others. No other cream separator manufacturer explains the construction of his machine—because no other cream separator is equal to the Tubular, and no other manufacturer cares to compare his machine to the Tubular.

The Tubular Bowl is small, light, made in three simple pieces—the bowl, cream guide, and bowl bottom. It is easy to handle—easy to wash—durable—a perfect skimmer. Other separators have heavy bowls filled with queer, hard-to-wash contraptions.

The Bottom Feed is Simple—merely feeds the milk into the bottom of the bowl—but it makes clean skimming fast—makes the low supply can possible. No other separator has it.

The Low Supply Can—hardly hip high—is easy to feed. Milk is always in view—machine is never top heavy. No other separator has it.

The Wholly Enclosed Self-Oiling Gears never catch clothing or fingers. They lubricate themselves. There is not an oil cup about the Tubular. Merely lift a cap—there they are before you. One teaspoonful of oil per week is all they need. No other separator has them.

We Guarantee the Tubular to skim twice as close as any other separator. The recent test held at Fairmont, Minn., again proves this true. Our competitors requested this test—named the terms—were well beaten. Three perfectly honorable and well known men judged the contest. Now, our competitors are telling trembling tales of "how it all happened." That is a trifle foolish, for we have the proof for any one who would like to know about it.

Would you like to know how it happened? **Write for Complete Report of the Test,** as taken from the Minneapolis Journal, and for Catalog No. 144

A Guarantee That Guarantees.

We desire to call special attention to the guarantee made poultry raisers by the Cyphers Incubator Co., Buffalo, N. Y. They warrant their incubators for ten years, and guarantee that they will hatch a larger percentage of fertile eggs and produce more vigorous chicks than any other incubator in the world, at the same time consuming less oil and requiring less attention. As the guarantee is backed by a large and responsible company, it certainly means something to our readers. They agree to refund the purchase price in case the purchaser does not get satisfactory results. The Cyphers incubator, as is now well known, is constructed on a patented principle entirely different from any other machine on the market; it is absolutely self-ventilating, self regulating, requires no supplied moisture, is automatic in action and has the most sensitive and accurate regulator made.

The company carries in addition a full line of "poultryman's necessities," standard articles specially prepared for the poultryman who wants to make money. They will send their new complete catalog for 1904 free if you tell them that you are one of our readers.

Try a Royal
30 Days Free.

We believe and claim that it's the best incubator ever made. Try it 30 days, if you don't like it you needn't keep it. Absolutely self regulating. Send for trial order blank. Incubator and Poultry Catalog free, with poultry paper one year ten cents.

A Reader's Estimate of the Advertisements.

ED. HOARD'S DAIRYMAN:—Enclosed find renewal of my subscription. As I am writing, I will take the occasion to say that I read your article a few weeks ago about your advertising columns and thoroughly agree with all it says. I make the advertising columns of HOARD'S DAIRYMAN worth a good deal of money to me. I have bought from the advertisers in HOARD'S DAIRYMAN during the last two years a Guernsey bull and two registered heifers, a separator and gasoline engine. I also practically bought a whole creamery outfit, for when we organized for our co-operative factory. No one knew where to get the supplies, and I told them I could easily find out from the advertising columns of HOARD'S DAIRYMAN, and it was left to me to get an agent here with plans for building and machinery. I've also bought bran and other feeds from your advertisers, and to tell you the truth, I don't buy much of anything without first lookiug over the columns of HOARD'S DAIRYMAN, and I find that in this way I not only buy more satisfactorily for myself, but in looking over the advertising columns, I find I get much interested, and a few postal cards occasionally give me a whole lot of information about things that I don't want to be without.

I don't see how an intelligent dairyman can consider it to his advantage not to often consult the advertising columns of the DAIRYMAN. I am buying from its columns all the time. J. E. ORTELL.

Ohio.

Cows Not Doing as Well as Last Year.

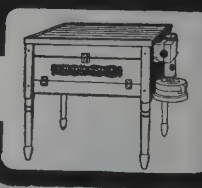
I am feeding at present about 15 lbs. of fodder corn without ears (it was just tasseled when I had to cut it), 10 to 12 lbs. of good clover hay and about 7 to 8 lbs. of bran and ground oats mixed, equal parts, to cows fresh this fall, and giving from 20 to 25 lbs. of milk daily. I am not satisfied with the results, as the cows do not yield as much milk as last year, although I am feeding nearly the same ration. I want to ask if you think it wise to add some oil meal at $25, with bran, $16.50, and oats, $20. A. J. M.

West Denmark, Wis.

There appears to be more or less complaint from many places that cows are not doing as well this year as they did last year, and a goodly number of farmers, not knowing any other cause, attribute this condition to the excessive rainfall last summer. Some claim that feed stuffs are not up to their usual quality, while others incline to the opinion that the cows themselves were more or less affected by the unusual weather. But whatever the cause, the fact remains. We can see no good reason why the feed mentioned above, whether in character or amount, should not produce satisfactory results, but it would be quite in accord with good judgment to try some oil meal, commencing with not more than a half pound a day and gradually increasing if results warrant so doing. Also, if not already doing so, give a large teaspoonful of salt night and morning.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.



Harness should often be washed with a pure soap to keep it soft and to avoid cracking. Oil may be applied afterward, and while the leather is wet. It is hardly necessary to have blacking in both soap and oil, and a black oil is perhaps preferable. Ivory Soap is easy to wash a harness with, because it lathers freely.

The mild purity of Ivory Soap fits it for many special uses for which other soaps are unsafe or unsatisfactory.

PROFITABLE "PEEPERS"

Welcome sounds—the first faint "peeps" from cracking shells—heard coming from the evenly heated egg chamber of the

Sure Hatch Incubator

Those sounds mean money profit for the owner. A Sure Hatch starts chicks in life with strong lungs, solid bodies and good constitutions. Our free catalogue C 14 tells how. Write now.

FROM MILL TO CONSUMER

You are interested in the strength, purity, uniformity and cost of the feed you buy. Direct dealing with the mill gives you information in regard to these points which you cannot secure when buying feed at random, in bulk.

Once having investigated a mill's product and finding it satisfactory, you can continue your buying from that mill with a confidence and assurance you cannot otherwise feel, providing the mill is reliable.

Buy **ELMCO** Feeds and you know exactly what you get. The Wisconsin Experiment Station has analyzed them, we herewith show the result.

University of Wisconsin Agricultural Experiment Station, Madison, Wis., November 6, 1903.

	Moisture	Crude Protein flesh forming substances	Ether Extract (fat)
ELMCO Red Dog	9.55	22.19	5.40
ELMCO Fancy White Mdls.	10.08	19.38	5.43
ELMCO Standard Mdls.	9.30	20.00	6.15
ELMCO Fancy Bran	10.00	16.63	4.78
ELMCO Mixed Feed	9.80	20.50	4.66

The analysis shows the feeds to be of superior quality. I have made a careful examination of the feeds and find them to be pure goods, without any foreign admixtures. F. W. WOLL, Chemist.

ELMCO Feeds are made from carefully selected hard Spring wheat, milled for best feeding results. They are put up in 100 and 200 lb. sacks, branded with our trade mark "ELMCO," which guarantees full weight, absolute purity and strength. Quality considered, they are the most reasonable feeds you can buy. They contain more protein and fat for a Dollar than ordinary feeds. Ask us for samples and prices.

Ask your Banker as to our reliability.

The Hatch Experiment Station Herd.

ED. HOARD'S DAIRYMAN:—The department of Foods and Feeding of the Hatch (Mass.) Station keeps about a dozen cows, mostly high grade Jerseys, for the purpose of carrying on a variety of dairy and feeding experiments. These cows, purchased from nearby farmers, at a cost when fresh of $50 to $75 each, are of the dairy type, and have yielded from 5,500 to 7,000 pounds of 5 per cent milk yearly. In this connection, it is desired to present the record of the grade Jersey cow, Pearl, which has belonged to the herd for a number of years. In appearance she may be regarded as rather coarse and angular. She possesses, however, the typical dairy form, having a large deep body and a pronounced pelvic arch. Her udder is large but rather defective in front. She dropped her last calf in December 1902. Her breeding is unknown,

MILK AND BUTTER YIELD.

DATES.	Pounds milk.	Per cent fat.	Pounds fat.	Equivalent 85 per cent butter.
Dec. 23-29	247.2	7.40	18.3	21.3
Dec. 30-Jan. 5	246.4	6.90	17.0	19.8
Jan. 6-12	244.4	7.15	17.5	20.4
Jan. 13-19	259.5	6.35	16.5	19.2
Jan. 20-26	249.5	6.33	15.8	18.4
Jan. 27-Feb. 2	242.2	6.40	15.5	18.1
Feb. 3-9	264.0	5.45	14.4	16.8

The cow was not forced, receiving daily 12 pounds rowen, 12 pounds hay, 3 pounds bran, 2½ pounds distillers' grains and 2½ pounds fine middlings. Later the feed consisted of 16 pounds hay, 30 pounds silage, 5 pounds bran and 3 pounds gluten meal a day. Shortly after calving, Pearl was in good flesh and weighed 1100 pounds. She constantly lost weight during the first few months, until about the middle of February the loss amounted to 170 pounds. It is evident that she could have profitably utilized a larger ration and it also seems probable that she took the fat from her body and transfered it into milk fat. Note that her average milk test two weeks after calving was 7.40 per cent fat, and that the milk gradually decreased in fat until the first week in February when it had reached 5.45 per cent. The milk did not go below 5 per cent fat, neither did the cow lose any more in weight, during the next few months. During the first six months of 1903 without extra feed, this cow produced 5,241 pounds of milk, averaging 5.54 per cent fat, equivalent to 341.59 pounds of 85 per cent butter, being a daily average of 29 pounds of milk and 1.9 pounds of butter, or 15.3 pounds of milk to a pound of butter. Unfortunately, through a misunderstanding, her milk record was not kept during July, August and September. She is now producing about 19 pounds daily of 6 per cent milk, and is thought to be safe in calf to a grandson of Brown Bessie's Son. It is believed that such a record is rarely equaled by animals from the herds of the most reputable Jersey breeders.

Amherst, Mass. J. B. LINDSEY.

In and In Breeding—Effects and Influences.

ED. HOARD'S DAIRYMAN:—The gain in constitutional vigor derived from an occasional cross between individuals of the same variety, but belonging to different families, or between distinct varieties, has not been so largely or so frequently discussed as have the evil effects of too close in-breeding.

The evil effects resulting from close inter-breeding are difficult to detect, for they accumulate slowly, and differ much in degree with different species, and, while using the term, evil results, it should be noted that the advantage of close inter-breeding in maintaining character is indisputable, and often outweighs the evil of a slight loss of constitutional vigor.

The consequences of close inter-breeding carried on for too long a time are, as is generally believed, loss of size, constitutional vigor, and fertility, accompanied by a tendency to malformation, but it is the opinion of authorities that these evil effects can be mitigated by separating the related individuals for a short time, and submitting them to changed or altered conditions of life.

That any ill directly follows from the closest inter-breeding, has been denied by many authorities (theoretical), but rarely by any practical breeder, and never by one who has largely bred animals which propagate their kind quickly. Evidences of the evil effects of close inter-breeding can most readily be acquired in the case of fowls and pigeons, and almost any breeder of such stock is conscious of the value which accrues from an occasional cross with another strain of the same variety. Many breeders, to avoid the expense of purchasing such crosses, keep two sets of live stock and occasionally cross one in the other.

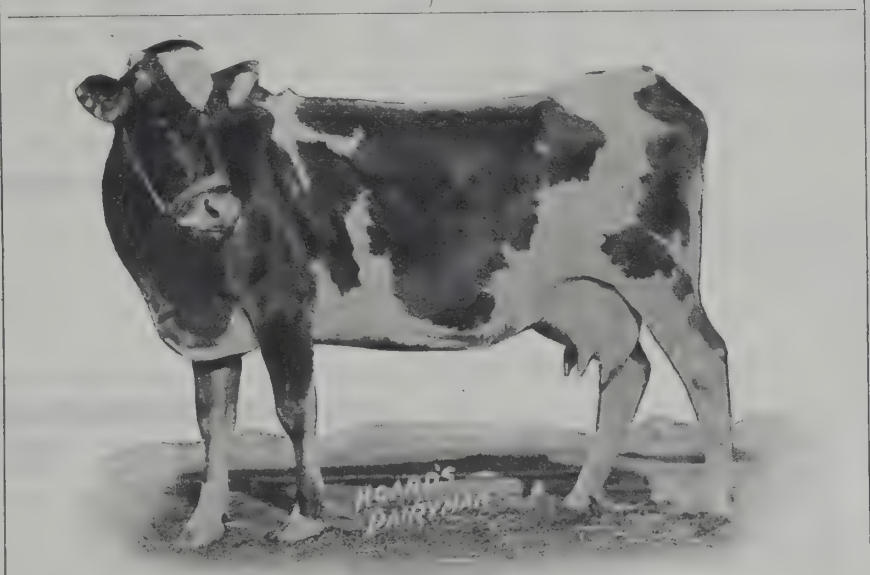
With cattle, close inter-breeding can be carried on for a lengthy period of time with advantage in respect to external characteristics and with no manifest deleterious, constitutional symptoms. This can be proved by a perusal, in the English Short-horn stud-book, of one notable case, in which a famous bull, himself the offspring of a half brother and sister, was mated with his own daughter, granddaughter and great granddaughter, so that the produce of this last union, or the great-great granddaughter, had 93.75 per cent of the blood of the original bull in her veins, and this great-great granddaughter was mated with a bull having 68.75 per cent of the same blood, and then yielded valuable offspring.

To sum up, I may say that to breed in-and-in from a bad stock is ruin and devastation, but the practice may be safely followed within certain limits when the parents so related are descended from first-class animals.

Though inter-breeding may be carried on in a herd without detriment to the individual animal, if we select the best animal for the purpose (as Nature does by the law of combat), there is no doubt of the advantage to be gained from a judicious cross, which advantage at once shows itself in the greater size and vigor of the offspring. Such crosses are extremely valuable as a means of procuring slaughter animals and such as are seen in the entries in the fat stock class at many shows.

The wild cattle at Chillingham Park (England) and elsewhere have been quoted in support of the theory that long continued inter-breeding does not deteriorate a herd. This might be due to the selection (by strength and vigor) of the sires, the weak and old bulls getting no chance to procreate their infirmities and deformities; but still from the records of even this herd there seems no doubt they are less fertile than the herds on the South American Estanchias, where crossing is common and they have certainly deteriorated in size, being (as they are) the descendants of the gigantic *Bos Primogeneris*.

In sheep, herds can be kept pure and up to type by close inter-breeding, and continue so for many years, but crosses are employed where certain characteristics or traits are required to be brought into prominence, be it increase in quantity or quality of wool, or greater flesh carrying capacity.



In some cases it has been advocated by certain authorities that a pure-bred variety can be crossed by a different pure-bred variety in order to give prominence to a certain point. For instance, during the past few years, as any frequenter of shows can tell, the types of dogs adorning the benches have undergone a change from their predecessors of 20 years ago, and the endeavor to attain superiority in their special lines (now judging by points is all the rage) have caused breeders to try all sorts of experiments to gain their end. In the case of the collie, for instance, where a flat head, thin tapering muzzle, and low set on ears is the ideal aimed at, some even have advised crossing once with a Borzois (wolf hound), which possesses the muzzle and skull, etc., so beloved by ardent admirers of the present stamp of Collie. There are many other theories of a similar type advocated and believed in, but proofs as to their utility are not always forthcoming.

It is much to be regretted that our writers on zoology have not, instead of the sheep, pig, cattle or cart horse, chosen the thorough-bred horse as the basis of their investigation in regard to the effects, evil or otherwise, of close in-breeding.

No species of animal in creation is so specially adapted for that purpose, for here incontestable facts are available as incontrovertible evidence; whereas in breeding spheres selected by zoologists much must depend on personal opinion, unsupported assertions, unreliable information and similar.

W. R. GILBERT.

Montreal, Canada.

GRADE JERSEY COW, PEARL.
Property of HATCH EXPERIMENT STATION.

Some Experiences in Milk Fever.

ED. HOARD'S DAIRYMAN:—Some ten years ago I started a herd of Jerseys, and naturally I expected more or less trouble with milk fever. Having had no previous experience I adopted the preventive method advocated by V. E. Fuller, the principal things of which were first, Epsom salts, before calving; second, a drench of the same immediately on calving; third, milking out clean three times a day. During the last eight years with a herd that did not average ten cows, I have had ten cases of milk fever. In every one of these cases this preventive treatment was carried out thoroughly, and I think I may be excused if I say that I have lost every bit of confidence in this kind of treatment. I have certainly had a very large percentage of cases, and if this preventive treatment was of any use it would seem that my cases should be much less.

NOW AS TO TREATMENT OF THIS DISEASE.

The first four cases that I had were treated with the old approved methods, viz., drenches, stimulants of whiskey and ammonia, hot applications to the spine and body, cold applications to the head; in fact, the orthodox treatment of ten years ago. As all the cases resulted fatally, my confidence in that treatment was necessarily jarred.

The last six cases that I have had were all treated with the so-called Schmidt treatment, that is, an injection was given in the udder of one quart of water which had been previously boiled, in which was dissolved one-fourth ounce of Iodide of Potassium. This treatment was repeated after four hours, and the solution injected was milked out after one hour. All these cases were followed by almost immediate recovery, and none of them were followed by udder trouble. No medicine was administered internally. I naturally have considerable confidence in this treatment, but in order to achieve perfect success, it should be given as soon as possible when the disease appears.

The very first symptom of milk fever is refusal to eat. This is followed in a few hours by a weaving of the body and staggering when the animal walks; soon after the animal falls down unconscious. I am satisfied, if this treatment is administered as soon as the animal refuses feed, it will prevent the unconscious stage of the disease. I had one case that I administered a treatment as soon as feed was refused. The symptoms of weaving and staggering followed with considerable severity, but eventually they subsided, and the animal did not get down.

I make it a practice now to visit the animal and offer her feed every four hours for the first two days, and even get up nights to do this, then I know that I will catch the disease on its first appearance. It is now over a year since I have had any case of milk fever. During this time I have adopted the method of not milking out the cow for three days, in fact, not milking her at all, but letting the calf have what it wants. It seems to be a better preventive than milking out.

It is very exceptional for a cow to have milk fever with the second calf. In the fall of 1902, I had a cow about to drop her second calf, and as the udder was very large and hard, I milked out ten quarts previous to calving; she developed a very bad case of milk fever. That was the last time I have ever practiced milking out, and the last time I have had any trouble. The same cow calved a few days ago, and is now giving thirty-eight pounds of milk per day with zero weather. She was not milked at all for the first three days, although carrying a very large udder, and she did not have the slightest symptom of the disease.

I give these experiences as a contribution to those of others. Taken alone they do not prove absolutely the error of my former treatment, or the perfectness of my present methods, but they have a tendency along that line, which the experiences of others may confirm.

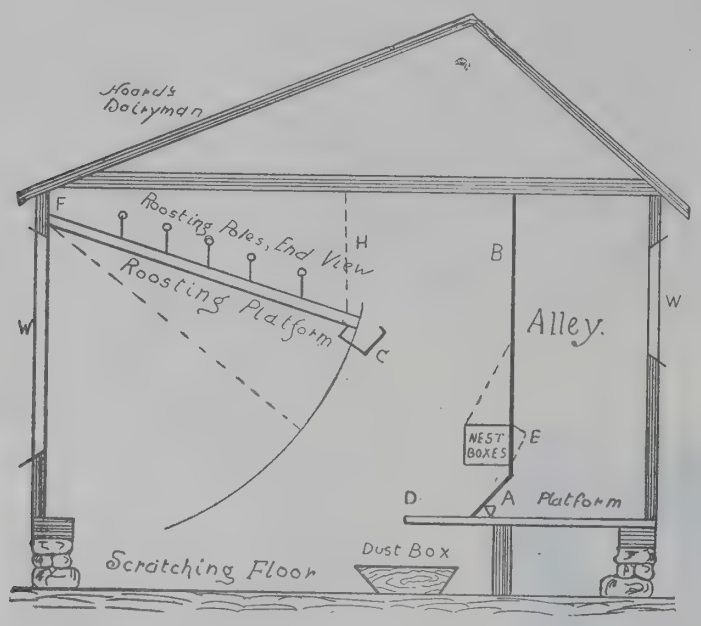
Adrian, Mich. J. W. H.

A Dairyman's Hen House.

ED. HOARD'S DAIRYMAN:—Many keep poultry and it is natural that they should do so. The by-products of the dairy are a great help in making out the daily feed rations. But some of our dairymen do

not get the results they should during the winter months, in the sale of high priced eggs, simply because they do not furnish the required environments for the winter laying hen.

No hen will lay eggs during these cold winter months, unless she has warm quarters supplied, and is well fed and cared for every day. At the same time, she must have plenty of exercise inside these quarters, and that necessitates the furnishing of a scratching shed.



The accompanying sketch shows a cross section of a cheap but substantial hen house that any farmer can make. The size of the building may vary according to the individual requirements. Some dairymen attach their hen houses to the barn or to some other main building, but we prefer to have it stand one side and away from other buildings containing live stock. This house may be arranged for a small flock or made into a long shed-like section for a number of flocks of one or more breeds of poultry.

retain the animal heat in cold weather, and also ward off the rays of the hot sun in "the good old summer time."

The foundation should be laid at least two or three feet deep, in a trench dug out and filled in with stone and cement, or cement alone If the walls are frost and moisture proof, then the scratching floor, which is on the ground, will be easily kept dry, clean and sanitary.

It will cost very little to build this hen house, if the farmer does the work himself. And some such a house is necessary if one wishes to secure eggs during the cold winter months. The writer has visited thousands of farm homes in several states and found a number of enterprising dairymen who keep hens for the purpose of getting eggs during the winter months when eggs are scarce and high in price. In another article we will write about the business hen in winter time on a progressive dairy farm.

Calhoun Co., Mich. J. H. BROWN.

The plan shown is very practical and of our own architectural design. It is 14x16 ft., and 7 ft. high at the eaves. The alley is 4 ft. wide and has a floor two ft. above the ground. This floor projects about three feet (D) into the scratching room, and forms a platform the whole length of the building, upon which the hens can stand while eating their morning mash. The mash is scattered along the trough (A), and narrow ,sloping slats prevent the fowls from soiling and wasting their feed.

The roosting platform is shown with the back end attached to the wall by loose pin hinges at F. Any inclination can be given this platform by means of the wire supports at H. Oil cup brackets filled with coal oil, support the ends of the roosting poles, which are readily detachable. By this arrangement no lice or vermin can secure access to the hens while they are on the roost at night. All the fixtures, including platform, poles, droppings trough (C), nest boxes, etc., can be taken outside for cleaning and disinfecting at any time.

The interior arrangement is very convenient for feeding the hens, cleaning out the nest box sections and gathering the eggs. The nest box section is 14 feet long. It is subdivided, with doors opening into the alley, giving easy access to each nest. These doors are hinged at their lower ends.

The alley is separated from the roosting and scratching room by means of galvanized wire fencing, and the sections are divided by the same material. It is better to keep the laying hens in small flocks, to secure the best results.

Any farmer with very few tools can make this hen house in a few hours time, after the foundation is laid. The frame is of 2×4 and 2×6 hemlock stuff, and the walls are covered with good German lap siding, well matched and jointed. In this cold climate the walls should be double, with a dead air space between. This will keep out the cold winds and maintain a more equable temperature within the building, during severely cold weather. In fact, more depends on having the hen house warm, than anything else, except the feed.

The roof boards should be laid close together, and covered with heavy, antiseptic roofing paper, then shingled. This makes the best and tightest roof, at the least cost in the end. It will

THE VALUE OF CHARCOAL

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

It's not LUCK that makes some dairymen more prosperous than others—it's the U.S. CREAM SEPARATOR

Note and Comment.

Down in Maryland—What is a Full Ration?—Milking a Heifer Once a Day—Silos in Egypt—The Silage Outlook—Feeding Silage—Two Fine Dairies—An Agricultural Paradise.

ED. HOARD'S DAIRYMAN:—Note and Comment finds himself at present in the commonwealth of Maryland, going up and down its by-ways and hedges, along its valleys and over its ridges, sometimes on very historic, colonial grounds, and anon on the places where history was written largely and with much blood, but where now Nature has spread the green carpet of peace with its woven patches of fields of tasseling corn, and waving grasses, and the bright-eyed daisies wave their hide-and-seek in valleys and meadows.

Today we drive along a pike where only a few decades ago legions of men in blue and gray marched and counter-marched and fought out, and to the end, the question of governmental destiny, and to-day we saw remnants of those armies meet and greet each other as neighbors, friends and co-workers, in making better the agricultural possibilities of the state, a thing they have been doing for years, and more; found them reading HOARD'S DAIRYMAN by the score, and testifying to its helpful influence in making dairying to them a profitable reality.

First I have a letter from South New Jersey from a noted dairyman there, who tells me that his reply to my inquiry not long since, "What is a full ration for a cow?" is, that he finds a full ration to be 8 lbs. mixed grain to the cow, of 2 parts bran, 2 parts gluten meal, 1 part cotton seed, 40 lbs. silage, 10 lbs. second crop hay and all the cut corn fodder they will eat, all divided into three feeds, and what they do not eat of the last is used for bedding. He advises also milking three times a day for the first three months. He finds that three feeds a day pays big, and wonders why dairymen differ so about twice and three times a day feeding and three times a day milking.

This is an open question, and ought to bring out replies *pro* and *con* in the DAIRYMAN. We feed twice a day, all of the silage the cows will eat up clean, with the meal upon it, and what hay the cows will eat in about three hours in the forenoon. They will be that long at it, eating and resting, and devote the afternoon to digesting this food. The six pounds of grain is the average, some a little more, some less, and the average yield of milk for all the cows, in all lengths of lactation, has been 27 lbs. per cow, something Mr. F. does not mention as the result of his plan of feeding. As I happen to know, he has a dairy of very fine Jerseys, Guernseys and Holsteins. He will no doubt milk me out of sight, but at what cost?

***

Now and then I come across something original, and it happened yesterday, and to the purpose, that a heifer the first year should only be milked once per day, that she will give quite as much milk, but the once a day milking expanded her udder. Nature is forced to develop new powers of secretion and ducts, and the second year you have a far superior cow to the one milked twice a day. Who else knows this? The other new thing was, that where Joseph's brethen cast him into a pit, it was a silo, one that "the old man" preserved the food for his herds, and that Joseph later on in Egypt, carried out this same idea in pitting the seven years' food with which to bridge over the famine. This was another new one, and we may now look for some explorer delving about in Egyptian ruins to unearth a pit of fine silage, put up by Joseph himself.

It looks to me as if there is to be a great revival of silage practice in this country. You find it everywhere, and now it is the beef feeders stimulated by western success in steer feeding, who are making the inquiries about silo building. The trouble will be in an unwise feeding which is likely to follow in some cases in thinking that silage is the whole thing, and is a complete single food, rather than a great aid.

Just recently I met a man who is feeding out his first pit of silage and his stock were going wrong, not milking well, getting thin and scouring. His ration was 50 pounds silage a day to the cow, four quarts corn meal and 2 lbs. bran and no dry food of any kind. Another man was feeding silage, cut corn fodder and 12 pounds of mixed corn and damaged wheat, and wondering why he could not attain the results of Herb Cook, and a score of others who feed silage. The steer feeders are liable to fall into the same error, and failing to meet expectations will charge it to false teaching by the men, who have by judicious practice made silage the best roughage feed yet devised.

Near Frederick city, made famous by Barbara Fritchie and her flag, are two great dairies, that of Hon. Mr. Braughman, and the other of Rush Lewis, and they are worth the trip of a cold day to see the perfection of detail in the management of these two dairies. The up-to-date practices are largely the result of reading the best dairy literature. Such men are an uplifting influence to the dairy industry anywhere, and I was not surprised to find a local firm building silos, putting up over 200 last year in the valley and expect this season to erect 500. A good silo it is, for truth, but best after all, their building simply indicates the trend of farm thought, and what is to be expected in the near future as to the harvesting of the greatest of our crops, and the effect it will have upon the markets when we feed this great crop to a purpose, instead of wasting half of it, as we are now doing taking the country by and large.

The possibilities of this great central valley of Maryland, are beyond comprehension. It is as fair a region as the garden of the Lord. No wonder the great armies found it an overflowing granary, as they marched up and down it, as well as the Cumberland valley to the west of the dividing ridge. The United States has three farm counties that stand out prominent in their productions, over all others, and in order, they are Lancaster, Penn., S ark Ohio and Frederick Md., and to secure a farm in either, makes the owner the resident of an agricultural paradise, literally flowing with milk and honey when the dairy industry becomes a prominent feature of these counties; and the farmer feeds his grain more largely, instead of selling it, as now, and turns raw material into the finest of refined table luxuries, milk, butter and cheese.

The population of the northern border counties of Maryland, partake largely of the German element, so conspicuous in southern Pennsylvania, and here one sees the huge red barns with their overhang, the great brick houses like fortresses almost, on the hillsides, and well fenced fields giving the whole a solid, enduring look, as if the occupation was to continue for all time, and nature's store house be always filled with the best things of flock, herd and field.

WELL POSTED.

A California Doctor With 40 Years Experience.

"In my 40 years' experience as a teacher and practitioner along hygienic lines" says a Los Angeles physician "I have never found a food to compare with Grape-Nuts for the benefit of the general health of all classes of people. I have recommended Grape-Nuts for a number of years to patients with the greatest success and every year's experience makes me more enthusiastic regarding its use.

"I make it a rule to always recommend Grape-Nuts and Postum Food Coffee in place of coffee when giving my patients instructions as to diet for I know both Grape-Nuts and Postum can be digested by anyone.

"As for myself, when engaged in much mental work my diet twice a day consists of Grape-Nuts and rich cream. I find it just the thing to build up gray matter and keep the brain in good working order.

"In addition to its wonderful effects as a brain and nerve food Grape-Nuts always keeps the digestive organs in perfect, healthy tone. I carry it with me when I travel, otherwise I am almost certain to have trouble with my stomach." Name given by Postum Co., Battle Creek, Mich.

Strong endorsements like the above from physicians all over the country have stamped Grape-Nuts the most scientific food in the world.

There's a reason.

After Reading the DAIRYMAN One Year 1199

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

AS IT IS IN INDIANA.

C. P. Goodrich took a cow census at Plymouth, Ind., a few weeks since of 50 farmers patrons of a creamery. Note the following facts: The total number of cows was 250: the average cost of keeping per cow was $24.96; the average returns in butter fat per cow was $32.20; the average number of pounds of butter fat per cow was only 166; the average net price was 19,4 cents: the average net profit per cow above cost of feed was $7.24; the average returns for $1 worth of fead was $1.29. The six patrons who read a dairy paper averaged $21 per cow over and above the cost of feed, while the 44 who did not read a dairy paper received only $5.58 per cow above the cost of feed. Does it pay to go without sound dairy reading?

COMING EVENTS.

Massachusetts Creamery Association, Greenfield.

Wisconsin Dairymen's Convention at Platteville, Feb. 10–12,1904.

THE FARM HELP QUESTION.

In commenting on the farm help question the *Prairie Farmer* seems to have set up a man of straw. It says: "One of the suggestions made is to induce the derelicts of the city to migrate to the country." We believe the DAIRYMAN was the first paper to speak of this plan but it said nothing about "derelicts" or saloon bums or people of that sort. It did say that there are a great many people who were bred on the farm in Europe, who have been stranded in the city with their families. A large proportion of these people are Germans and Scandinavians. The *Prairie Farmer* says: "Their whole education has not been towards doing good work, etc." This is a very superficial view of the case. The best hired men we have now are just this kind of people. The only education they ever had industrially, has been towards farm work. There are thousands of such men who have families of young children. They land in the city with but little money. They must get work at once, so they drift into warehouses, or work on the streets. They would very much prefer to have a neat little house on some good farm with a quarter of an acre of ground, two quarts of good milk a day and their potatoes and other garden truck, with good wages besides, and the chance to fatten a couple of pigs, to the miserable life they are now living. Why will these men not make good farm laborers? They were good farm help in the old country. The only practical reason they are not helping the farmers today is because the farmers have made no effort, as other business men would have done, to induce them to settle on the farm.

It will not require a very large expenditure for the farmer to put up a comfortable tenant house and fence off a quarter of an acre of good ground. These various et ceteras of domestic life count a good deal more to the laborer than they do to the farmer. The farmers of this country cannot go on as they have done, waiting to have the laborer come along and ask for work, or else try to hire a brother farmer's help away from him. There is but little good business sense or sagacity in the present state of affairs. It is vastly easier to set up a lot of artificial or fancied objections to the scheme, than it is to organize and try it.

But of one thing we are certain, and that is, that something must happen soon to bring about a more healthy balance between the congested labor of the city and the unreasonable scarcity of help which exists on the farm.

BUTTER FAT AND TALLOW FAT.

Dillwyn Stratton of Ohio puts the question of this dual-purpose dairy farming before the readers of the *Ohio Farmer* as follows:

In my experience I have not known a man to stick to the production of both butter fat and tallow fat. When he figures the cost of each he finds it not so very different, but when he sells them, the butter brings five times as much as the beef, which of course has a tendency to settle his views.

It is hard to kick against the pricks. It is hard to make some men look at this dairy business in the right light. Even long years of pain in the pocket, hard toil all the year and no profits, will not teach them. Mr. Stratton ought to be able to find thousands of farmers who will stick to an unprofitable cow if she is only "dual-purpose."

A SERIOUS SCARCITY OF FARM HELP IN THE EAST.

A friend and subscriber of the DAIRYMAN sends us an account of the very serious lack of farm help at Watkins, Schuyler county, N. Y. He states that the farmers in that section of the state are so affected by the impossibility to secure farm hands that they are selling off their cows and reducing all their farm operations to what they can do themselves alone. He further states that there are lots of potatoes and beans not yet gathered, and he prophesies that many farms will be abandoned another year. There is no doubt that the rage for labor in manufacturing towns has more seriously affected farmers in extensive manufacturing states than in the more pronounced agricultural states farther west, yet it cannot be denied that in the west even, the high cost and scarcity of farm labor is beginning to be very perceptibly felt. Our correspondent draws the following picture of how it is with himself:

"Last spring I started with three men. The 10th of August the last man was hired to the railroad. Since that time I could not get a man at any price. By changing work have managed to get some of the farm work done. Think of a man 78 years of age trying to carry on a farm under such conditions. I paid $25,000 for the farm 26 years ago and to all appearances it has advanced in quality. I have not heard of a man who will work a farm since my men left. I will give you some idea of the depreciation of farm real estate. Twenty years ago the farm next west of me sold for $80 an acre. Last April it sold on long time at $17 an acre."

Watkins, N. Y. C. B.

The above statement discloses a situation that calls for the most earnest consideration. It shows the very serious difficulties our eastern farm brethren are laboring under. Not only are they prevented from carrying on their farms as their necessities demand, but they must stand idly by and see their capital fade out of their possession. These farmers are growing poorer every year. In some portions of New York, in the alfalfa districts about Syrcuse for instance, farmers are doing well. It seems that both prosperity and adversity present the appearance of a patch-work quilt. We cannot help believing however, that the bottom cause for very much of this decline of land values is to be found in the decline of fertility in the soil. There does not seem to have been a clear, determined farm spirit and conviction guiding the destinies of the New York farms. This slack-twisted condition has prevailed for years. Then again, most of the so-called prosperity exists in the towns. The cities and villages of New York have swept the country aside in politics, in the making of the laws, and in absorbing the supply of labor. Marked changes have taken place and the farmer has not correspondingly changed in his ideas and methods. They have allowed their farms to run down in productive power, and about the only remedy to stay the evil has been the purchase of expensive commercial fertilizers.

Exhaustion of land and pocket has been the predominating symptom, except in those localities where a larger use of brain power has been made the rule. Over large areas of farming country in New York and New England, these discouraging features prevail. It is hard to rouse such men to better and more determined effort. The only remedy they see is to grow smaller instead of larger; do less farming instead of becoming better posted farmers. All honor we say to that noble body of farm teachers in the colleges and Farm Institutes who are striving by might and main to hold up against such serious discouragements.

So far as the help question is concerned we believe a year or two more will witness a change for the better. Already labor is becoming badly congested in the manufacturing towns. It must soon turn towards the farm. Of course, such a condition will reduce the consuming power of the laboring masses and bring down the price of farm products. But labor will be more abundant and less expensive. But the great and crying necessity with the eastern farmers, in our opinion, is to reorganize their minds, their judgments, and the conduct of their farms. The malign spirit of waste prevails too generally. The old time, snug, thrifty farmer, with a neat, well kept and well tended farm is too much the exception. Thousands of farmers have forgotten to sow clover. As the soil became more sterile the hazard of growing it became greater, until its use has disappeared from thousands of farms. The old time balance in the soil between humus and the mineral constitutents has been seriously disturbed and instead of sowing more clover, more mineral manures have been purchased and used.

We do not wonder the eastern farmers are discouraged. But after all that can be said, the only cure for the woes of poor farming is *good* farming. It is the only road out of any and all difficulties.

TIMOTHY HAY.

We have often wondered where so many farmers got their idea that timothy hay was a profitable food for cattle. The following table gives the per cent of protein in various kinds of farm hay as compared with wheat bran:

	Per cent protein.
Bran	12
Alfalfa	11
Red clover	8.6
Timothy	3

All of the above figures are based on the supposition that the hay is cut and rightly cured when the plant is at its highest per cent of protein.

Yet in face of the above chemical analysis there are thousands of farmers who will raise and feed timothy under the supposition that because the horsemen of the cities will pay more for it than for other hay, it must be the best. The Missouri Experiment Station found that one bushel of corn fed with alfalfa, produced twice as much beef as when fed with timothy. In our own experience in feeding alfalfa to horses, we use only half as much corn as a grain ration, as we do if we are feeding the same weight of timothy. Besides, the horses appear stronger, better fleshed and show more energy every way. It is quite evident that if it were not for the agricultural chemist to analyze and fix the proportion of values in our farm plants, we would never find out the truth from the so-called practical feeder. So much for what science is doing for the farmer.

THE MEMORY OF TASTE.

The memory of taste is one of the most subtle and enduring of all mental impressions. Who among us cannot remember just how mother's cooking tasted, or who cannot remember distinctly the taste of every apple in the old home orchard. Mrs. Frederick C. Johnson of Winfield, Kan. writes the *Jersey Bulletin* describing how she once sent a little roll of her nice butter as a present to a lady friend who was matron of a school in California. The following answer was eloquent of her friend's appreciation of the merits of good butter.

"I did not dare eat it for a long time; the aroma was so sweet I could just look and smell; that was feast enough. I have been so hungry for a taste of eastern butter like we used to make in old York State, you would laugh to see how I cut off little bits and taste and taste again. Oh! it was so good."

TOO MUCH POOR BUTTER.

There seems to be almost a universal cry going up this winter from the great market centers concerning the unusual amount of poor butter that the creameries are sending out. Of course there will be all sorts of reasons offered for this unfortunate condition of things, and at the end it all comes back upon the farmer, who produces the milk. He is getting hard slaps in the face, or pocket rather, even if he don't seem to realize or know that he is being hurt.

The creamerymen are not much hurt. They get just as much for making poor butter as good, but if two to four cents are knocked off the price, it comes out of the dividend for the milk at last.

The *Elgin Dairy Report* says: "Why so much poor butter on the market?" The commission merchants and dealers in Chicago and New York take up the same cry. The *New York Produce Review* says: "It seems difficult to find a real intelligent reason for the low average quality of the butter produced this winter."

The DAIRYMAN will venture an opinion as to the cause. As every one knows, the winter butter is made from stable milk, and it has been a very severe winter from the Atlantic to the Rockies. We doubt if there has been a winter in 30 years where the cows have been kept in the stable so constantly as the present one. Not one cow stable in ten thousand has any provision for furnishing the cows with pure air. Most farmers think if air is cold, it is pure. They have learned that cows will not give milk profitably unless they are kept comfortably warm. So they shut up the stable tight to hold the heat, with no regard whatever to the purity of the air. The consequence is the cow breathes the rank foul air, made foul by all the excrement and urine, and the gases thrown off in breathing.

A gentleman, who buys live stock, told us the other day that he had never seen so many foul smelling stables as the present winter. What effect must such conditions have on the quality and fine

flavor of the butter, and finally on the price of butter?

Some day the men who keep cows in these United States will learn that one of the most profitable things they can give their cows during the long winter days is pure air.

MORE AND BETTER KNOWLEDGE.

An eminent railroad manager was asked how it was that the railroads had reduced the loss of life so greatly in the last 30 years in proportion to the number of people carried. "Why," he said, "that is very easily answered. It is because we understand our business better than we used to."

It is in the light of this very idea that we want every reader of the DAIRYMAN to read well the valuable contribution of J. W. H. page 1179 of this issue. The experience of J. W.H., is a strong answer to the question: Will it pay a dairy farmer to spend a little money to keep well posted concerning his business.

SHREDDING CORN FODDER.

The situation with those farmers who have a large corn crop is one of considerable difficulty. All that portion of the crop that goes into the silo is disposed of early and easily, but with help scarce, just how to husk the balance, get it into the crib in good season and away from rats and mice ready to feed is a problem.

As a consequence, fields of unhusked corn can be seen all over the land, ready to come in as a hindrance to the work next spring. A number of people have tried the husking machine and shredding the fodder, but here comes up another difficulty, for the shredded fodder is apt to heat and mold when thrown into a large mass. Some are pursuing the practice of hauling a few loads of corn stooks from the field once a week and husking and shredding it. In that case the fodder does not heat enough to hurt it. But this practice compels the leaving the corn in stooks in the field all winter, much of it getting down and all of the fodder injured more or less by exposure to the weather.

A friend writing us from Minneapolis, relates how he husks his entire corn crop early in the fall, shredding the fodder and running it into a large shed. This shredded fodder is sprinkled with salt and placed with alternate layers of dry oat straw. Our correspondent states that the fodder keeps well, and the cattle do well on it.

Some day we hope our makers of corn husking machinery will build a husker that will husk the corn and rebind the bundles of fodder in much the same manner as it comes from the corn harvester. With such a machine the farmer could go on with his corn husking, clearing it up early in the fall, and then stack his corn fodder when he desires.

Cause for a Poor Yield of Cheese.

ED. HOARD'S DAIRYMAN:—I would like to hold forth a question concerning the yield of cheese at our factory. What is the cause of a poor yield and what remedy is there for same? Do you recommend to salt the curd immediately after milling it, or when is the proper time? Don't you think it will improve flavor and retain butter fat by working curd for a certain length of time after milling and before salting.

Pilot Mound, Minn. A SUBSCRIBER.

In answer to the questions asked by "A Subscriber" of Pilot Mound, Minn., would say that there are several causes for the poor yield of which these people make mention. A good deal, for instance, is lost in the whey at this time of the year, when the milk is oftentimes far advanced in age. That is, as a rule, the milk is being delivered but once in two days to the cheese factories. Oftentimes the fat of the milk is churned out to a considerable extent through transportation, and by having been held for so long a period, and delivered to the factory at temperatures ranging in the immediate neighborhood of churning temperatures.

Another cause is, if when the whey is drawn off, the curd is not in proper condition, that is, if it is still soft, insufficiently cooked or firmed, or charged with whey, there will surely be a loss of yield, as the condition of the curd changes, and its texture weakens to such a degree that it cannot resist the action of the press and at the same time retain the butter fat.

Again, some makers experience an additional loss of fat by grinding or milling the curd at too high a temperature. The curd, when too hot, is not firm enough, and instead of being cut is torn apart, thus putting the texture in bad shape, and to this is added the influence of the too great heat which softens the curd, and the loss of fat and yield in such cases will be easily appreciated.

Still another cause, and perhaps the most common cause for the losses of fat, is due to bad milk. Milk that has not been properly cared for at the farm and delivered at so low a temperature as to defy detection until having been warmed up in the vat, resulting in bad flavors and gassy curds. This is important to the milk producer, and he should bear in mind that badly cared for milk always occasions a loss of yield.

We should constantly keep in mind that the butter fat is largely freed from the effect of the casein, which holds it mechanically, and that by too much hand-stirring and manipulation of the curd at time of racking, grinding and salting, we are continually liberating this fat. But by careful handling in every part of the process and by cooling the curds previous to grinding, we fix the butter fat and retain it in its proper position. The curd should be milled when it becomes flaky and shows from one to one and one-fourth inch acid, as shown on the hot iron. Then air well by stirring immediately after milling and every two minutes until ready for salting. In hot weather the curd should not be covered after milling, and the temperature reduced as much as possible before putting the curd into the press. All cheese curds should be well matured before salting. No cheese curd is ready to salt and hoop at time of milling. The milling or grinding should come about half way between the time of racking or dipping the curd and that of salting it. A cheese curd, when ready for the salt, should be mellow and have assumed a smooth, velvety texture, with a flavor resembling that of rich, ripe cream when ready for the churn.

Madison, Wis. U. S. BAER,

An Equitable Way to Build or Pay for a Creamery.

ED. HOARD'S DAIRYMAN:—I see so many questions of value answered in your valuable paper that I would like to ask you to give us some good plan that would be just to all concerned to pay for our new creamery. We have 75 shareholders, each share $50. At annual meeting held last winter it was decided to build a new, model creamery, which has been accomplished. At said meeting, it was voted to raise the sinking fund 2 per cent and assess $10 on each share. Would you advise to repeat and make another assessment at our annual meeting this winter to raise the $7,000 we still owe on our new building and machinery, etc. Cost of new creamery, lots, sewer, etc, is about $11,000 and we handle about 5,000,000 pounds of milk each year. Some of the stockholders are not patrons of creamery. Some patrons bring much milk to the creamery and some less, as is the case in most creameries.

If you can find time to give us some plan that would work more satisfactorily than this, you would greatly oblige us.

Minn. J. M. N.

The most equitable way would be to provide for the payment of the creamery out of a sinking fund created by withholding a cent or fraction thereof from each pound of butterfat, and when the plant is paid for, give to each patron such a share as his milk contributed to the fund. By this method each patron would hold as much stock as his milk paid for, and those who paid cash should have as much stock as they paid for in cash.

Annually, after the plant is paid for, there should be a reasonable dividend declared to the shareholders as interest on the investment, and no more. The patrons who bring the milk are the ones who make the creamery a success and their interests should take precedence, but those who advanced money are also entitled to a reasonable interest on it. Later on, it may be well to refund to the cash contributers their money and confine shares to those who contribute milk, thus making the enterprise a purely co-operative one. Cash shareholders, not patrons, are no help to a creamery association if its financial standing is such that it can borrow what funds it needs.

An Extra Good Holstein in California.

Can Loss of Flesh be Prevented?

ED. HOARD'S DAIRYMAN:—I have a Holstein cow that came fresh the second of December, and in 30 days gave 1,460 lbs. of milk that tested 5.3 per cent butter fat. The last 10 days I milked her 3 times a day. By doing this, she gave as high as 60 lbs. a day.

Could you give me a balanced ration out of the following feeds, that would keep such cows up in flesh: Wheat middlings, $28 per ton; wheat bran, $21; oil cake meal, $30; ground mill feed, $23.50; rolled barley, $25.50; corn meal, $32. My cows have for roughage all the good wheat hay they can eat up, and run in pasture that dry stock will keep in good order on.

I am very much pleased with your paper; have never seen its equal. I have been trying to get some of my neighbors to subscribe. but have not succeeded yet, but will keep trying. There are very few dairies in my neighborhood. L. A. H.

Eden Vale, Cal.

We do not think a cow yielding 60 lbs. of milk per day, or 1,460 lbs. in the first month after freshening, can be profitably fed so as not to lose flesh. If it was attempted to do this, we should very much fear serious injury to future dairy capacity, by establishing a habit of turning the feed into beef channels. It is strictly in accord with nature's law that copious milkers should lose more or less flesh, during the 30 to 60 days after freshening. See the illustration and comments on the cow Pearl page 1179, this issue.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain sepecific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Cooling Cream—Cooking Feed,

Which is preferable for cooling cream from separator, a dry refrigerator or deep setting in running water? Are the Farrington ripeners made in dairy sizes, and if so where can they be obtained? If a ripener is used, is a starter required? What is the best temperature at which to keep cream before ripening?

Would you advise cooking grain fed to milch cows? E. B. A.

Brimfield, Mass.

For cooling cream or milk, deep setting in running water is by far the most preferable.

The Farrington ripeners are not made in dairy sizes. Under dairy conditions, where the milk and cream can be kept clean there is no necessity for a starter.

Before ripening, cream can be kept at 40 degrees for a short time, but it should be remembered that the sooner the cream is made into butter and placed on the market the better will be the product.

Experiments have shown that it does not pay to cook feed for cows; it costs more to cook the feed than the extra returns will pay for.

Alfalfa in Wisconsin.

Can alfalfa be grown in Wisconsin? With proper care how long will it live without killing out? How many crops can be cut in one year? And what kinds of seed do the best? G. R.

Sparta, Wis.

In this locality alfalfa is being grown with success. There is no data to show how long the alfalfa will live in this state, but there are fields five years old in this locality that show every indication of growing for an indefinite number of years, if proper care is taken of them. Three crops are cut here each year; the seed is northern grown.

Cheese Product and Value of Milk.

We bring our milk to a cheese factory and we sometimes find a mistake in adding out the lbs. of milk and we like to know if we have 3.8 test and one lb. of cheese is worth 11 cents, how can they find out what a hundred pounds of milk will bring if the milk tests 3,8, and how many lbs. of cheese in one hundred lbs. in such milk?

Kiel, Wis. A. A.

One hundred pounds of 3.8 per cent milk should make from 9¼ to 9¾ lbs. of cheese, depending largely upon the condition of the total milk from all the patrons when mixed in the vat. If one or more patrons bring tainted or gassy milk, the yield will be materially cut down. There are many other causes that will affect the yield more or less. If we estimate the average yield to be 9½ lbs.; then, after deducting the cost of making, say, 1½ cents, from the price the cheese sells for, 100 lbs. of 3.8 per cent milk would bring approximately 90 cents.

Dropsy—Contents of Silo.

How many tons of green corn fodder does my silo hold? It is a stone silo 6 ft. by 25 ft. high.

I have a Jersey cow that calved about 2 months ago. She came in 5 days ahead of time. She was dry about 50 days, was extra large with rather a small calf. When the water broke it made her look very flat or thin; the udder did not increase in size, and only giving about 3 quarts at milking, by 9 in the past when fresh. For 4 times she came in heat each 9th day, was bred twice and came in heat 6 days after the last time served.

Perris. Cal. J. N. K.

There is a dropsical condition of the uterus, the cause of which must be ascertained by a personal examination; employ a qualified veterinarian.

A silo 6x25 ft. will hold 13 tons of silage if it is filled to the top.

A Problem in Warmth and Ventilation.

Will calves and cows in box stalls generate enough heat to warm their stable and make the King ventilation system work in this climate?

Could their stable be warmed by heated air from adjoining cow stable and have good ventilation in both? How many cubic feet of space could be warmed per 1000 lbs. of weight of cows? Could the room the calves could warm, be figured out by using answer to last question? Do you think the King system could be used in a hog house? Would it be necessary? The thermometer often goes below zero every night for a week or more here. L. R. P.

Plattsburgh, N. Y.

Properly used, the King system of ventilation aids in keeping a stable warm, because it draws off the cold air from the floor, thereby allowing the warmer air at the ceiling to come down. Care must be exercised not to have the exits open too wide and thus draw off the air faster than it can be tempered by the heat from the bodies of the stock. Whether any warmth would come from an adjoining stable would depend upon the provision made for the air to circulate. If the room for the box stalls is fully partitioned off from the main stable, an opening at the top would allow warm air to flow in provided there is some way for the cold air at the floor to escape. King states that not less than 370 cubic feet should be allowed for each 1000 lbs. live weight of animals, and then provide for changing the air from six to ten times every hour. Under ordinary conditions, a flue 2 feet square in a stable for 20 cows will accomplish this.

Swine require about 2½ times more fresh air per 1000 pounds live weight than cows, and there is no reason why the King system of ventilation would not work well in a hog house.

Two Washington (State) Ration Formulas.

Please formulate for me two distinct balanced rations for cows weighing 1,000 lbs., and giving 30 milk lbs. First ration having brome hay roughage; second ration having baled alfalfa hay for roughage. Bran per ton, $15.00; shorts per ton, $18.00; oat chop per ton, $20.00; barley chop per ton, $21.00; corn meal per ton, $30.00; oil meal per ton, $32,00; beet pulp per ton, $3.00. M. W. J.

Washington.

We are unable to find any satisfactory feeding analysis of brome hay, but accepting Prof. Shaw's statement, in "Grasses and How to Grow Them" that it is practically equivalent to timothy in feeding value, the formulas which follow would be reasonably well adapted for cows weighing 1,000 lbs. and yielding 30 lbs. of 4 per cent milk daily.

NO. I

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. brome hay	17.36	.56	8.68	.28
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. oats	3.56	.37	1.89	.17
2 lbs. oil meal	1.82	.59	.65	.14
Totals	26.26	2.02	12.76	.71

No. II.

20 lbs. alfalfa hay	18.32	2.20	7.92	.24
4 lbs. oats	3.56	.37	1.89	.17
4 lbs. barley	3.56	.35	2.62	.06
Totals	25.44	2.92	12.43	.47

In so far as chemical analysis can determine feeding values, the total nutriments contained in the above formulas vary but the equivalent of one pound of carbohydrates, and this is in favor of formula No. 1. We are strongly of the opinion, however, that formula No. 2 will be found on trial to produce the better results.

The price named for beet pulp appears to us to place it beyond consideration. Beet pulp is accounted to have but one-half the feeding value of corn silage, and the latter is valued at about one-third as much as good hay.

A Massachusetts Ration.

I am feeding 8 quarts bran, 3 quarts gluten feed, 1½ quarts corn meal, ⅔ bushel ensilage, and what clover mixed hay they will eat up clean a day. Herd consists of 40 head of mixed cows, making 460 quarts milk a day. Could I change that any so as to get more milk on a cheaper ration? Bran, $20; gluten feed, $26.50; corn meal, $22 50; clover hay, $14; can get red dog at $25.50; Chicago gluten meal, $32.50; mixed feed, $24.50; ensilage is very full of corn.

Massachusetts. SUBSCRIBER.

Translated into weights, these cows are now receiving approximately 4 lbs. bran, 3.6 lbs. gluten feed, 2.25 lbs. corn meal, and yielding an average of 25 lbs. milk daily. The daily allowance of grain is therefore nearly 10 lbs. and costs 11.3 cents. If these cows are kept in fairly warm and ventilated stables, are not compelled to drink water below 55 degrees in temperature, nor left out in cold or stormy weather to get exercise by arching their backs, we see no good reason way they should not give just as much milk, as at present, if fed 40 lbs. of silage, 6 lbs. clover hay (or 30 lbs. silage, and 10 lbs. hay) 4 lbs. bran, 2 lbs. gluten feed and 2 lbs. ground corn. This is a total of 8 lbs. grain, costing 8.9 cents,—a reduction of 2.4 cents daily for each cow, and amounts to 96 cents for the entire herd, or $6 per week.

It should not be forgotten that the amount of grain suggested is the average for the entire herd, and hence that the cows yielding more than 25 lbs. of milk should receive more, and those yielding less than 25 lbs. proportionately less.

A Vermont Ration—Cows to be Fresh Next March.

Will you please give me a ration which will give the best results at least cost, and one that will pay to feed, with butter at 22 cents net? The cows are grade Jerseys and Ayrshires. Have timothy hay for roughage. The following grains can be obtained: Ben Hur mixed feed, $23; corn meal, $23; gluten feed, $27; cotton seed meal, $28; corn and oats, $27. Will Sanford corn give enough better results to pay to keep it until the cows come fresh, in March? E. E. P.

Richford, Vt.

One must not expect much present profit from cows that are expected to freshen next March, any more than he would expect profit from cutting grain before it is headed out. In fact, it is about time such cows were fully dried off, if they are to have six weeks's rest, which is none too much for most cows.

Nevertheless, such cows should be well nourished from this time until they freshen. To this end they should have all the hay they will eat without any waste and from 2 to 4 lbs. of ground corn and oats, and salt every day.

After these cows freshen, and the fever incident to parturition has subsided, they should gradually be brought to full feed, which will be hay as above, and probably about 4 lbs. bran and 4 lbs. gluten fed daily. Corn is too low in protein to go well with timothy hay.

Proper Feed for Heifers

There is in our neighborhood a bunch of twelve heifers from twelve to eighteen months of age that are being fed timothy hay of a poor quality and nothing else as a winter's feed. Now, can they ever make first-class dairy cows? Will not this kind of feeding, at this time of life, put them where they will always fall below a good milk production? B. H. C.

Adena, Ohio.

We would not like to bring up dairy heifers on such feed. Timothy hay at its best is a highly carbonaceous feed stuff and not adapted to the growth and development of muscular tissue. It serves as feed to keep up bodily warmth and tends to the production of body fat. With such hay there should be at least a moderate daily allowance of bran or oats, or both.

A Ration Criticised

At present we are milking 70 cows that average 20 pounds of 4.20 per cent milk. One-fourth of these cows are fresh, the remainder were fresh last spring and summer. I am feeding cows that give 35 to 40 pounds a daily ration as follows: 5½ lbs. bran, 4 lbs. corn and cob meal, 2 lbs. cotton seed meal with all the mixed hay they will eat up clean. To the smaller and ones that have been in milk longer, I reduce the ration. These cows are the all-purpose cows, weighing from 1,290 to 1,400 lbs. and are Short-horn blood. Milk brings 20 cents per gallon. The cost of feed is: bran, $17; cotton seed, $28 and corn 40 cents per bushel. What I want to know is, am I feeding properly?

A READER.

About the only fault there can be found with the above ration is that it contains nothing to keep the digestive tract in first-class condition. In the absence of silage or roots, we would deem it advisable to have some linseed oil meal in the ration, enough at least to keep the droppings from becoming too dry and hard. We therefore advise dropping out 1½ lbs. bran and adding 1 lb. of oil meal, and for the 35 to 40-lb. cows, we are not certain that 2 lbs. of the oil meal would be any too much. And see to it that the cows have salt every day. Salt is not only an appetizer, as we all know from our personal experience, and large milking cows must eat liberally, but it aids digestion and assimilation

Rotting Squash.—Squash Seeds.—Scalding Milk to Expedite Churning.

My squash are afflicted unto death or corruption; about one ton, decaying fast. Spots of white mold on surface under which the flesh becomes white and punkey, no bad smell. Cow and horse will eat them if thrown to them whole. I write to ask if any harm comes from feeding them, and how freely. Do the seeds of pumpkins or squash do harm? I notice that if quite soft—as we would call rotting—the animals do not hesitate to take them down, soft—seeds and all.

Let me thank that lady correspondent who told us through your paper to scald the milk and we could get butter without churning two or three hours. We tried it and got butter in 15 minutes. D. F. H.

East Onondaga, N. Y.

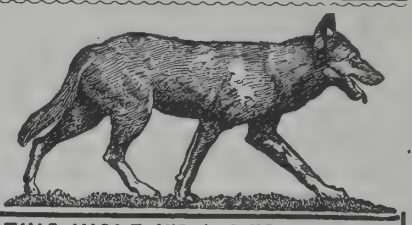
It is not expedient to give any kind of stock, rotten feed. Small amounts, in connection with larger amounts of sound feed, would probably do little or no harm and less good. A cow should have, and richly deserves to have, just as sound, pure, healthful food and drink as her owner. The seeds will do harm.

Manure Sheds

I notice that some of the barn plans mentioned in your paper have a manure pit or shed away from the stable. Can you describe one that is economical in construction, and yet built to prevent leaching. How far away from the stable should they be, and what is the most economical way of conveying the manure from the table.

Massachusetts. SUBSCRIBER.

In this locality we would build a shed, using cedar poles of medium length, set two feet or more in the ground, for posts to support roof. Excavate a foot or more of earth with gradual slope in all directions to center; tamp the soil firmly and cover 4 inches deep with Portland cement concrete, and over this a thickness of one inch fine mortar,—two parts sand to one part cement. The best, as well as the most economical, way of getting manure from stable would be one of the litter or manure carriers described in our advertising columns. The distance between stable and shed is not so material as it is to locate the latter where it will be least in the way, and most convenient to get at and away from with loaded wagon.

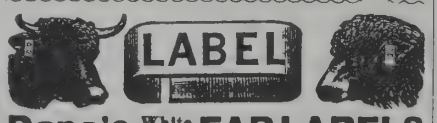


Problems of the Alfalfa Grower.

[A paper read at the Chino Farmers' Institute by V. GUSTAFSON.]

The problems of the alfalfa grower may not be as intricate and difficult of solution as many problems of the fruit grower. Having a splendid home market, the question of transportation does not enter as one of the problems of the alfalfa grower; being adapted to cattle, horses and hogs, the market is practically unlimited. Being immune from diseases and hardy, its cultivation is comparatively easy. Yet there are problems to solve in connection with alfalfa growing, which, if not solved correctly, will lead to failure or indifferent success.

The first problem to solve is to find the selection of land adapted to alfalfa growing, if one does not already possess it. A rich, deep, sandy loam with good drainage is best. Yet it seems to do well on heavier soils if the subsoil is loose and free from alkali. The subsoil should be free from hard pan so as to allow the roots to penetrate to a depth of at least ten feet.



Having found the land so adapted, the next problem is the water supply. If he land is situated so as to recieve the irrigation water from a river whose supply

Twentieth Century Buying

The up-to-date consumer has ceased to allow his shopping affairs to worry him. He makes out his order from our large catalogue, sends it and we do the rest. We began pleasing and saving money for our customers over 32 years ago, and our remarkable success since that time is only a true mark of the people's growing trust in us and our methods.

We buy good goods, tell the truth in describing them, and sell them at wholesale prices. The consumer can buy fresh goods and enjoy the same low prices as does the dealer. Our oldest customers buy the largest bills of goods, because the larger the order the more money saved.

We accept all the responsibility, and guarantee that what you buy shall be satisfactory—whether it be a 25-cent or a 25-dollar purchase. If you try us once you will see how easy and pleasant a matter it is to deal with a strictly honest and accommodating firm.

Begin Saving Today. Cut out the coupon, send it to us with your name and address and 15 cents in partial payment of the postage on our 1128-page catalogue.

With this book in your possession it is an easy matter to sit comfortably by your own fireside and order your supplies for months in advance with a few hours' pleasant effort.

Your saving in the course of a year will surprise you, for you can buy many supplies from us for less money than your dealer pays for the same goods, thus saving even more than his profit on them. Besides, when buying from us you are enabled to select what you desire from a stock as large and varied as a thousand ordinary stores, and you are not obliged to buy what can be found in the small stocks of your local tradesmen.

Bear in mind that whatever you want—we have it. Don't put it off. Send in the coupon today before you forget it.

We Want You to Try Us

and test for yourself our ability to please you. Tell us what kind of goods you are interested in and we will send you without charge any of the following illustrated special catalogues quoting wholesale prices. Merely mention the number or letter of the catalogue you want.

can be depended on, then that problem is easy; but where the supply is to be lifted from wells by means of pumping, it becomes more difficult and costly, and the alfalfa grower must see to it that the conditions are as nearly ideal as possible, as he must figure on coming into competition with growers who have exceptional facilities for irrigation. As a rule, it may be said that it will not pay to raise water more than 75 to 100 feet, but this must be governed by the amount of hay that can be raised to the acre and the average price received in different localities.

Having satisfied himself that the conditions are right as to quality of land and water supply, the next problem is the leveling of the land, This is an important part of alfalfa growing, and if this is done in a bungling way it will result in heavy loss to the grower. The low places will receive an overdose and the high places little or no water. Gophers will find a safe retreat in the high places and destroy the stand. The result is, weeds will grow on the higher spots and lower the quality and the quantity of hay.

Having leveled the land properly for irrigation, next in order is the seeding. I consider the time from the 15th of September to the 15th of October the best time for seeding alfalfa. An exception may be made on the low alkaline soil where danger of frost is much greater. The alfalfa sown in the fall will grow during the winter months and be much more advanced in growth than alfalfa sown in spring. Another advantage of fall seeding is that many kinds of weeds that spring up with the alfalfa are killed or crippled by frost during the winter, leaving a clean stand of alfalfa.

The soil should be plowed from 10 to 12 inches deep preparatory to seeding, be thoroughly pulverized and very firm near the surface, taking care that the top layer to a depth of about one inch be finely pulverized. The seed should be scattered with a seed drill made for the purpose. This will insure a more even stand than scattering by hand. From 15 to 30 pounds of seed should be sown to an acre, depending on the nature of the soil. On coarse, sandy soil, more is required than on heavy soil.

Having secured a good stand, the next problem is to keep it in good condition for growth. The cutting as well as the irrigating must be done at the right times to insure best results. In the spring and early summer of the first year the alfalfa should be cut frequently. This I have found to be very beneficial to the stand, as it will thicken the stand and insure heavier crops the first season than if left too long before cutting. Alfalfa should always be cut when about one-fifth is in bloom. If left longer it will result in poorer quality of hay and injury to the stand. The curing is very important, as careless handling will result in loss both to the producer and the consumer. No more should be cut at one time than can be raked and stacked in a short time with the help at one's disposal. In the summer, when drying winds are the order of the day, the hay must be shocked as quickly as possible after cutting. This will retain the leaves and aroma so much relished by both cattle and horses.

Last but not least, we have the irrigating problem. This is the most important part of alfalfa growing. This must be done at the right time and in the right manner, applying the proper quantity for best results. The proper time to irrigate alfalfa I have found to be immediately after clearing the land of the hay from the previous cutting. No rule can be laid down as to the proper quantity to apply, as soils differ greatly in the amount of water needed for a crop. This must be determined by the individual grower and is not a difficult problem. The manner of applying the water will, to some extent, determine the quantity required. Water standing to any considerable depth for several hours will pack the soil, resulting in rapid evaporation of water from the soil. Alfalfa so irrigated will, after being cut, turn dry and brown at the stubble, and prevent side branches from growing from the stubble, New stems will grow from the crown, which grow very coarse, and will to some extent lower the quality of the hay.

In conclusion, there is no crop with which I am acquainted that gives surer returns and is a more constant source of satisfaction to its owner than a well cared for alfalfa field.

Tanning a Hide With the Hair On.

ED. HOARD'S DAIRYMAN:—Answering an inquiry from one of your subscribers in a recent issue, the following is a method employed for tanning deer skins, sheep skins, etc, with the hair on; I dont know whether it has been tried for cow hides. Scrape off all the fat with a blunt knife Then take the brains of the animal, or the brains of any other animal recently killed, and work them into the hide on the flesh side; this renders it pliable. Then take 1 spoonful of alum and 2 of saltpeter, pulverize and mix. Sprinkle this on the flesh side. If the hair side is greasy a little weak lye will take it out. Yellow ochre mixed with the brains gives a fine color to the under side.

If brains are not available, the whites of several eggs or the soaking of the skin one half day in oil or lard is said to have the same effect. S. G.

Ahuntsic, Quebec.

Made for the Man Who Wants the Best.

THE GREAT WESTERN Manure Spreader

is the only Spreader made that has an **ENDLESS APRON** and the many advantages which it possesses. It's always in place and ready to receive the load without any turning back either by hand or complicated, easily broken machinery. VERMIN PROOF CHICKENS.

Lice prey upon chickens. This is one of the great bars to profit in poultry. But it need not be so. The fumes from

Prussian Lice Killer

catch every louse. The fumes penetrate every hiding place. There is no hiding from it under feathers or in cracks or corners of roosts. The chickens are not affected—do not mind it, but its use means louse destruction. Just paint it on the floor, walls, boards, roosts, etc of the hen houses. Should you prefer the powder treatment don't forget the reliable **Prussian Lice Powder**—Price 25c; mail 40c.

"We can recommend your Prussian Lice Killer to any one who has poultry. Please quote us prices on one gallon and five gallon lots."—F. M. WAY, Maynard, Iowa.

Prices, 50c and $1.00; 5 gallons, $4.00. Don't forget that we make the famous **Prussian Poultry Food also.** If your dealer does not keep it, write to us. Our 68 page stock book sent free.

CONCERNING OUR ADVERTISERS

The Wasson Stanchion, one of the best swing stanchions on the market, is made by the Wasson Stanchion Co., Cuba, N. Y., and is now advertised in our columns. They claim many points of advantage for this stanchion, among them the following: Freedom of cow in getting up and lying down, without exertion or laming back. Freedom to turn her head on either side, with comfort and absolute security of position, thus allowing her to lick and care for herself. Giving comfort to the cow, it requires less feed and produces a greater flow of milk, and will, therefore, pay for itself in one year.

THE OAT WONDER.

The editor must tell his readers of this marvel. It originated with the largest farm seed growers in the world, the John A. Salzer Seed Co., La Crosse, Wis. It has stiff straw, stands up like a stone wall, is white, heavy, and has long ears, filled to the top with fat, plump kernals. It is a great stooler, 80 stocks from one kernel. If you will send this notice and 10c in stamps to above address, you will get a sample of this Oat Wonder, which yielded in 1903, in forty states from 250 to 310 bu. per acre, together with other farm seed samples and their big catalog.

The saw mill plant of the De Loach Mill Manufacturing Co., of Atlanta, Ga., who are regular advertisers of ours, is said to be the largest of its kind in the world. They not only have size to their credit, but have every other advantage, such as cheap labor and an abundance of the best lumber, steel and iron at hand to turn out a superior product. They thus have every facility for making good their claims of making the best saw mills in the world for the money. We do not know that their claims are disputed. Upwards of twelve thousand of the De Loach mills are now in use in all sections of the country. This fact alone is strong evidence of the high character they bear. The same concern makes a long line of machinery, closely related to the saw mill, such as lath mills, shingle mills, edgers, planers, etc. Also grinding mills, water wheels, gearing, pulleys, shafting, etc. The De Loach catalog is a valuable machinery book for any one interested. It is mailed free.

A SUCCESSFUL VETERAN.

You might hardly feel like calling him a veteran if you should see him, because he stands straight, moves quickly and has a clear bright eye. But when a man has been hustling at the same business for more than forty years, if he isn't a veteran what is he? Then, too, he has succeeded, as you can readily see from the broad acres devoted to growing evergreens and other ornamental shade and forest trees, shrubbery, etc., for it is D. Hill, of Dundee, Ill., whom we are talking about. Mr. Hill has grown and shipped many million trees in his lifetime and has millions more coming along. His name is a household word all over this country and in many foreign countries. Write for his catalogue "Millions of Trees" and mention this paper. Address as above.

Look for Marvin Smith Co's buggy advertisement in this paper. It's very attractive and they are making some very low prices. If you want a vehicle of any kind the advertisement will interest you. We guarantee their responsibility.

Making a Concrete Stable Floor.

ED. HOARD'S DAIRYMAN:--I want to tell you how to make a floor for long and short cows. Last fall I put down a cement floor in the new barn and made platform for the cows to stand on 4 ft., 8 in. long. Where the cows stand, no topping coat was put on, but instead 4 in. of concrete. The walks, gutters and feed alleys were made 3 in. of concrete and 1 in. topping coat. Lengthwise of the platform a 2×4 was placed edgewise and 2 in. plank spiked on for the cows to stand on.

The floor has a slant of 1 in. and the gutter was made 2 ft. wide and 4 in. deep next to the platform and 4½ in. next to the walk, which allows the liquid to run to back side of gutter. For the cows who are long enough to require a longer platform one or more 2×6 are spiked firmly onto the rear of platform.

I find that an ordinary aged Short-horn cow needs a stall 5 ft. long. The stalls are 3½ ft. on centers and a partition of two 2×12 placed 1 in. apart, one above the other. At the rear a 2x4 is set up so that it will be on the side of the stall next to the milker, or the right side. The manger was raised 2 inches and 2 inch plank placed on the bottom which makes it 4 in. above the floor.

Deerfield, Wis. F. A.

DAIRY MARKETS.

ELGIN, Ill., Feb. 1.—Butter ruled firm on the Board of Trade to-day, at 23c a pound, an advance of 1c from last week's quotations. Several lots were offered at 25c and not sold. Sales in the district for the week were 430,000 pounds.

WYANDOTTE

Dairyman's Cleaner and Cleanser.

Thousands of people KNOW and profit by the use of **Wyandotte Dairyman's Cleaner and Cleanser,** but there are many more thousands who are still using the greasy soaps and soap powders or the "fiery" caustics. They labor early and late in the vain attempt to keep everything sweet and clean.

Wyandotte Dairyman's Cleaner and Cleanser contains no grease, no fat, no caustic it will produce no **suds** or **lather.** To learn and know the true value of Wyandotte Dairyman's Cleaner and Cleanser is only to use it in the right way (see directions). With Wyandotte Dairyman's Cleaner and Cleanser the removal of the staleness in the milk can, the slimeness in the pail, the stickiness in the cream crock or the greasy "feel" in the milk pan, becomes a pleasant duty.

WYANDOTTE
DAIRYMAN'S CLEANER AND CLEANSER

with little labor, little time and no worry quickly removes all butter fat, milk sugar, dirt or other impurities, leaving everything sweet, clean and pure.

Ask your Creamery or Cheese Factory for a 5-lb. sack of Wyandotte Dairyman's Cleaner and Cleanser. Use it everywhere throughout the dairy and for general household cleaning. It is pure and purifying, doing no harm or injury. If the creamery or cheese factory cannot supply you, write us.

NEW YORK MARKET.

NEW YORK, Jan. 30—Butter—Receipts for the week, 27,794 packages. Exports for the week, 3,090 packages.

There was more business done this week and all table qualities brought advanced prices. Extra fresh creamery was in light receipt, good demand and price was marked up half cent pound and closes with advancing tendencies. Finest June creamerics were dealt in very freely; one long block was reported sold at 19c, and many sales were recorded of 50 to 100 tubs at 19 to 20c, while goods a trifle under in quality went at 18 to 18½c. Odds and ends of New York State dairy sold at 14 to 15c. All under grades of butter are in full supply, and trade is light and prices easier. We quote:

Creamery, fresh, extra, 22½c; medium, 20@22c; poor, 16@19c; Creamery, June, extra, 19@20c; medium, 18@18½c; poor, 14@17c; Dairy, extra, 20@21c; medium, 16@18c, poor, 12@15c.

Cheese—Receipts for the week, 11,822 boxes. Exports for the week, 8,193 boxes.

Market is steady on finest grades of full cream cheese, but for all other kinds, buyers have the advantage and for any considerable line, easier prices are readily made. Exporters took quite liberally of under grades full creams and good to fine skims at about quotations. We quote:

Full Cream, extra, 12c; medium, 10@11c; poor, 6@9c.

Eggs—Receipts for the week, 20,292 cases.

Arrivals were cleaned up each day; market closes with sales at 35c per dozen.

177 Chambers St. DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Jan. 28—Butter—So far this week there has been little, if any, change of importance to note in the condition of our market. The receipts of all kinds, suitable for table purposes, continue very light, and the market for the moment is quite bare of desirable stock; while on the other hand stock that will not messure up to the standard is not only in ample supply, but accumulating. Held creamery of fancy quality is in fair request. Imitation creamery and Ladles continue in ample supply. Rolls—All receipts of choice sweet stock meet ready sale; but the general run of stock is meeting with slow sale, owing to the undesirable quality. Packing stock is in full supply and dull sale. Blocks and Prints—All receipts are showing more or less imperfections, The market in general, though quiet, rules steady on all desirable offerings.

Creamery separator, extras, 23c; firsts, 21@22c; seconds, 18@20c: Held creamery, extra 21@22c; firsts, 20c; seconds, 17@19; imitation creamery, extras, 19c; firsts, 17@18c; seconds, 14@15c; Roll Ohio, extras 14½@15c; firsts, 13@14c; seconds, 12c. Creamery blocks, blocks (2 lbs.) extras, 24c; firsts, 22@23c; seconds, 19@21c. Creamery prints, (½ lb.), extra, 25c; firsts, 23@24c; seconds, 19@21c; Md. Va. & Penna. prints, extras, 23c; firsts, 21@22c; seconds, 18@20c. Renovated butter, extras, 18c; firsts, 16@17c; seconds, 13@15c.

Cheese—The receipts owing to the cold weather are nominal; there is a fair demand, and the rules firm on all desirable offerings.

N. Y. State Cheddars, fine, 10½@11c; choice, 9¾@10c; fair, 9@9¼c; do Flats, fine, 11@11½c; choice, 10½@10¾c; fair, 9½@10c; do small, fine, 11½@12c; choice, 10¾@11c; fair, 10@10¼c; Ohio Flats, fine, 10@10½c; choice, 9@9¾c; fair, 8½@9c; Ohio Picnic, fine, 10½@11c; choice, 10@10½c; fair, 9½@9¾c; Swiss (Domestic) new, fine, 14½@15c; choice, 13@13½c; fair, 10@12c.

Eggs—With moderate receipts and a brisk demand, our market has been gradually advancing. On Monday of this week, the market opened at 30 cents, on Tuesday 31 was readily obtained, and on Wednesday no one would sell for less than 32; but the buyers are very conservative and will only take what they need from day to day; today the market closes firm and fairly active at 34 cents, but the impression prevails that the prevailing prices will retard the demand to a certain extent, but that remains to be seen.

READING NOTICES

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—Single man for retail milk route. State wages and experience in first letter as this is position of trust and will expect employe to furnish bond with a Guarantee Co. or furnish satisfactory references. A. J. DAUGHERITY, Streator, Ill. 52-tf.

For Sale, Cheap—The controlling interest in cheese factory and machinery, in south-western Wisconsin. For particulars address P. O. BOX 51, North Milwaukee, Wis. 51-3

Guernsey Cattle—Clover Knoll Herd. Orangeville, Pa. Bargains in bulls. M. SAGER, Mgr. 52-tf

For Sale—At a bargain, one Russian Turbine Separator, 1200 lbs. per hour. Milk receiving vat, bottle washer, 216 bottle sterilizer, milk pump, two 60 gal weigh cans and one rotary pump. DALLASTOWN CREAMERY CO., care of H. S. Gross, Dallastown, Pa.

Hello, Fellow Dairyman.—Have you bought that Guernsey bull yet? Before buying you had better write A. H. HINMAN, Allenville, Wis. 52-4

For Sale—A registered Brown Swiss bull calf, seven months old. Well bred, large size, and fit for service the coming season. JOHN LUCHSINGER, Monroe, Wis.

For Sale—One first-class four ton refrigerator machine complete. J. E. ROBISON, Cedar Vale, Kansas. 51-2

Holstein-Friesian bull calf of distinguished butter strains cheap. SPECIAL LIVE STOCK EXCHANGE, Monticello, Wis.

Buff Jersey will buy cows for you. Give you up-to-date instructions in dairying, breeding and feeding, at your homes. Superintend silo construction and other buildings. Abortion herds cured. Cows brought to freshening free from milk fever. Beef herds changed to the ensilage system of feeding. Will give lectures before students, farmer's institutes and conventions. Compile dairy farm pamphlets, and send to you prepaid for 50c paper or 75c cloth bound, my book on silos and nine other chapters of useful knowledge. Correspondence solicited. BUFF JERSEY, Monmouth, Ill 51-tf

Farm for Sale or Rent—A desirable stock and dairy farm in Winona Co., Minn., 13 miles below Winona, 2 miles from R. R. depot, 1,400 acres good land all fenced, well watered. There is on the farm a good 8-room dwelling house, two large barns, dairy building with churn, vats and implements for making butter, steam engine and 10 h. p. boiler, 75 cows, 450 high grade Shropshire ewes, 100 Angora goats, young cattle and hogs. Running water in all the buildings. Will rent farm on shares with stock, or sell farm with or without stock. LLOYD BARBER, Winona, Minn 51-3

For Sale—Four Yearling Holstein-Friesian Heifers, and three-year-old Bull, all registered. Bull's dam as two-year-old made 12.80 lbs. butter official test. Heifers bred to this bull. KRIPPNER BROS., Route 1, Fort Atkinson, Wis. 52-tf.

For Rent—Dairy farm of 160 acres. 25 cows with milk route. Will sell cows and rent for cash, or sell half interest to practical man and rent on shares. C. T. VAN AKEN, Hillsdale, Mich.

Wanted—Position as helper in a butter or cheese factory, by a young Danish dairyman. State wages. S. P., care Hoard's Dairyman.

If you have any stock to sell or wish to buy any write us. SPECIAL LIVE STOCK EXCHANGE, Monticello, Wis.

The infinite superiority of the De Laval Cream Separator over all other separators is not difficult to understand---the superior features of the De Laval stand out so prominently that they completely overshadow the "claimed" advantages of imitating machines. The De Laval out-classes them in every point, and wherever cream separators are mentioned, it is the unanimous opinion that the others are not "in the running" with the ever-leading De Laval.

For Sale—Well established dairy in best and healthiest city in the South. Price $3,000. For full particulars address BOX 529, San Antonio, Texas. 50-4

A First-class, experienced butter maker desires a position in the West or Northwest. Up-to-date work guaranteed. Address A. TOBLER, Nora, So. Dak. 49-5

$25 to $50—Buys a highly bred Jersey bull from 2 to 20 months old. St. Lamberts, Stoke Pogis or Tormentors, from the best herd in Ohio, Write now to P. CLAWSON, Okeana, Butler Co., Ohio. 49-5

For Sale or Rent—The whole or part of 260 acres, two set buildings, convenient to school, church, creamery and market. Known as the Hiram Campbell place, Cottage Grove, Dane Co., Wis. Address BOX 44, Milton, Wis. 51-4

Yorkshires—Spring sows open or bred for spring farrow by imported boars, and fall pigs at fair prices. W. H. FISHER, Columbus, O. 51-4

Of Interest to Factory Secretaries—Mr. C. H. Bickford, of Adams, N. Y., who is secretary of several large cheese factories in that locality, has discovered a device which greatly shortens the work of the factory secretary. This device consists of a peculiar arrangement of figures which enables the secretary to read off at a glance, with perfect accurcy, and without performing any arithmetical operation, the number pounds of butter fat in any number pounds of milk from 1 to 19999 pounds inclusive, and having any test from 3.1 to 5.9 inclusive. Mr. Bickford will mail free on request, to any one interested, a sample chart and directions, which fully explain his system. Tell the secretary of your factory about this. It will save him much time and labor and many mistakes. 51-tf

Wanted—A first-class butter maker, German preferred. Must come well recommended. Will pay a good salary to the right man. Call on or address H.S. MEYER, Sec'y., Wellsburg Farmers Creamery Co., Wellsburg, Ia. 51-tf

For Sale—Five Guernsey bulls from one to eleven months old. One Guernsey heifer 11 months old. JOHN MAUL, Rome, Wis. 51-4

For Sale—Victor combined churn No. A, good as new, $50. NOAH L. SPRUNGER, R. F. D. 3, Dalton, Ohio.

A First-class Butter Maker wants a position after March 1st, in Idaho or Washington. Address "T." care Hoard's Dairyman. 52-3

Holsteins—Bull calves at farmers' prices, sired by Dinah Johanna Sir De Kol. H. F. WEAVER, R. F. D. 3, Elkhorn, Wis. 50-3

For Sale at a Bargain—One Barber ice machine of eight tons refrigerating capacity, in good running order; one turbine power DeLaval separator 2,500 pounds capacity an hour. Also one rotary pump, a Marsh pump and other second-hand creamery machinery. Please address NEBRASKA—IOWA CREAMERY CO., Omaha, Neb. 52-2

For Sale—Young Guernsey bulls and bull calves from dams with records, at reasonable prices. M. G. HATHAWAY, Trenton Junction, N. J. 52-3

Wanted—March 15, 1904, a first-class dairy farm hand. Write, giving references. T. E. HANFORD, Mason City, Iowa.

Wanted—The output of two first-class creameries in Michigan. None but those making highest class goods need answer. State price delivered in Cleveland based on Elgin weekly prices for 1904. GREENWICH CREAMERY CO., Greenwich, Ohio. 52-2

Wanted—A recent graduate of the Wisconsin Agricultural College wishes to change location, seeks position as a manager of a medium dairy farm. Can make first-class butter. The last place raised the butter from 30c to 50c per pound. Can feed scientifically and run steam, gas or gasoline engine. Address COMPETENT, Hoard's Dairyman. 52-4

For Sale—10 cheese factories, 5 farms 40 to 160 acres, saloon, dance hall and store. FRED HADLER, 775 Ida St., Appleton, Wis. 43-tf

Wanted—Position as herdsman on ranche or dairy farm. Single. A 1 references and years of experience. M. C. WOODGATE, Kalamazoo, Mich.

For Sale—Choice reg. Guernsey bulls and bull calves. RAY C. BICKNELL, Ft. Atkinson, Wis. 32-tf

I have a few Guernsy Bull Calves whose dam's and sire's dam have an average yearly record of from 643 lbs. to 747 lbs. butter. Individually they are desirable to head thoroughbred herds. CHAS. SOLVESON, Neshotah, Wis. 50-tf

To California—Via the Chicago, Union Pacific & North-Western Line. Two solid fast trains through to California daily. The Overland Limited (electric lighted throughout) less than three days en route, leaves Chicago, 8:00 p. m. Another fast train leaves Chicago, 11:35 p. m. Apply to Agents Chicago & North-Western R'y. 51-7

The Overland Limited—The Traffic Department of the Chicago & North-Western R'y has issued a handsome booklet descriptive of the Overland Limited, the most luxurious train in the world, and of the Chicago, Union Pacific & North-Western Line, the route of this famous train to the Pacific Coast. Fully and interestingly illustrated. Copy mailed to any address on receipt of 2-cent stamp, by W. B. Kniskern, P. T. M., Chicago. 51-7

Very Low Rates to Mardi Gras and Winter Resorts—Via the North-Western Line. On account of the Mardi Gras, excursion tickets will be sold to New Orleans, Mobile and Pensacola, Feb. 9 to 14, inclusive, also to New Orleans, on Feb. 15, for trains arriving at New Orleans by noon on Feb. 16, with favorable return limits and stopovers. Excursion tickets are also on sale daily, at reduced rates, to the principal winter resorts in the United States and Mexico. For full information apply to agents Chicago & North-Western R'y. 51-6

Excursion Rates to Wisconsin Dairymen's Convention at Platteville—Via the North-Western Line. Excursion tickets will be sold at reduced rates Feb. 9, 10 and 11, limited to return until Feb. 13, inclusive. Apply to Agents Chicago & North-Western R'y. 51-6

Dairy Questions Answered by Prof. Farrington.

MILK AND CREAM OVERRUN.

"I am connected with a co-operative creamery and wish to ask the following question in regard to overrun. Suppose that during the year A. brings 1000 pounds of butter fat in the form of milk testing 4 per cent, and B. brings 1000 pounds butter fat in the form of 40 per cent cream as indicated by test. Is it just for each to receive an equal share of the overrun or is the cream overrun more than the milk, when both milk and cream are received at the factory? Is it just to divide the overrun according to the number of pounds of butter fat furnished by the different patrons?" * * *

Clintonville, Wis.

The overrun from cream should be from three to five per cent greater than that from milk, because when the overrun is calculated from the cream fat no account needs to be taken of the loss of fat from the skim milk. You will see, therefore, that a patron delivering cream, testing 40 per cent fat to your factory ought to receive pay for this cream on a different basis than when delivering 4 per cent milk. The best way to equalize the difference between these two products, milk and cream, is to determine how much fat there was in the milk from which the cream was skimmed. This will reduce the cream patrons and the milk patrons to the same basis and when this is done the same overrun may be used for both of them. I think that such a calculation as this is much more satisfactory and far less complicated, that is, it requires less figuring than it does to pay the milk patron on the basis of one overrun and the cream patron by another.

The best way to determine how much fat there was in the milk from which the cream was skimmed by the cream patrons is to add to the cream fat delivered by such patrons an amount equal to the fat lost in the skim milk. This may be assumed to be three per cent, as it has been found by careful observation that by skimming milk at factories about three per cent fat in the whole milk is left in the skim milk. This does not mean that the skim milk tests 3 per cent; it will test about .1 of one per cent which is three per cent of the fat in milk of average test. If we accept this figure, the method of calculating will be as follows: Multiply the weight of cream delivered by each patron by the test of his cream and the product will give the pounds of fat delivered in the cream; then multiply these pounds of fat in the cream by 1 03, that is, add three per cent to the weight of cream fat, the product obtained by this multiplication will give very nearly the amount of fat in the milk from which this cream was skimmed. We will then have all the patrons on a milk fat basis and they can all be paid the same overrun.

THE CURD IN THOROUGH-BRED MILK.

"Please let me know if a cow of common or so-called scrub stock gives milk of a larger percentage of curd nutrition than pure Jersey or Guernsey breeds. A doctor here claims that scrub-stock-milk contains more curd nutrition than full blood or part full blood stock does. Please inform me about this matter." * * *

Alcott, Colo.

The great mass of chemical analyses of milk from cows of many breeds and of no particular breed shows conclusively that there is no good foundation for the statement that the milk of a scrub cow always differs in composition from that of thorough-breds. There are many cows of no particular breeding that give very rich milk and others that give thin milk. It cannot be safely assumed that because a cow is not a thorough-bred her milk is less nutritious than that of another cow with a long pedigree. The milk of cows of the same breed will often vary as much in composition as does the milk of grade cows or scrub stock.

I do not know that it ever has been demonstrated that the amount of curd in milk, measures its nutritive value. I am of the opinion that the fat and the milk sugar are as nutritious for food as is the curd. I think it has been demonstrated that in many cases these latter two ingredients are much more digestible than is the curd.

It is true that the milk of some of the pure breeds is richer in fat than that of cows of other breeds and that along with this richness in fat there is usually a slight increase in the percentage of curd which the rich milk contains over that of the thinner milk. But these peculiarities are not the sole characteristic of thoroughbred cows. Those having no pedigree often give milk fully as rich in curd and fat as the thorough-breds.

STARTING A CREAMERY.

A co-operative creamery company has been organized in this neighborhood. We have completed the organization, sold stock and elected officers. We have incorporated for $4,000, and expect to use this sum, or as much of it as is necessary to build and fit up a creamery. We think we shall provide a building large enough to hold the machinery for manufacturing the milk of 1,500 to 2 000 cows. At present the machinery need not be more than enough to manufacture the milk from 1,000 cows. A large number of our patrons will use hand separators. We should like to have some suggestions from you in regard to this enterprise, and hope you will also send us the names of responsible dealers in creamery supplies, as you evidently are better acquainted with them than we are, and we want to act intelligently in getting this creamery started. * * *

Menomonee, Wis.

It will be a good investment for so large a company as the one you describe to engage some man as manager, and pay a salary sufficient to secure the services of a competent person. This man will do well to devote his time to the study of the building, equipment and operation of several successful creameries. After he has thoroughly posted himself in this way, by talking with the managers and patrons of a number of factories, he should write to some of the creamery supply firms and get plans and specifications from them of creamery buildings. When he has received these, and has also, from his study of other factories, determined about the kind of factory which will best suit the locality, it will be a good plan for him to consult some local carpenter or contractor and have him draw plans and make an estimate of the cost of the creamery building. It is often much more satisfactory and sometimes cheaper to have the creamery built by local carpenters than to give the contract for building and equipping to some supply firm at a distance, who will be obliged to bring the lumber and men for erecting the creamery from a distance.

During the time the building is being erected, the manager can make out a list of the machinery needed in the creamery and submit it to several creamery supply firms for their prices. It is always economical to buy the best machinery and that which has shown by its use in other places to be durable. Cheap things are always the most expensive ones to buy and this rule applies to creamery machinery and fittings as well as to other things.

By adopting some such a plan as this, you will get a satisfactory creamery, provided the man you put in charge of the business is a competent person. I think it is much better to start an enterprise in this way than to leave the business in the hands of a larger number of men and dividing up the responsibility so that one man looks after some things and another after others. You can pay a good busi-

"ADVERTISEMENT."

DIDN'T BELIEVE

That Coffee Was the Real Trouble.

Some people flounder around and take everything that's recommended to them but finally find out that coffee is the real cause of their troubles. An Oregon man says:

"For 25 years I was troubled with my stomach. I was a steady coffee drinker, but didn't suspect that as the cause. I doctored with good doctors and got no help, then I took almost anything which someone else had been cured with, but to no good. I was very bad last summer and could not work at times.

"On December 2, 1902, I was taken so bad the doctor said I could not live over twenty-four hours at the most, and I made all preparations to die. I could hardly eat anything, everything distressed me and I was weak and sick all over. When in that condition coffee was abandoned and I was put on Postnm, the change in my feelings came quickly after the drink that was poisoning me was removed.

"The pain and sickness fell away from me and I began to get well, day by day, so I stuck to it until now I am well and strong again, can eat heartily with no headache, heart trouble, or the awful sickness of the old coffee days. I drink all I wish of Postum without any harm, and enjoy it immensely.

"This seems like a wonderfully strong story, but I would refer you to the First National Bank, The Trust Banking Co., or any merchant of Grant's Pass, Oregan, in regard to my standing, and I will send a sworn statement of this if you wish. You can also use my name." Name given by Postum Co., Battle Creek, Mich.

Still there are many who persistently fool themselves by saying "Coffee don't hurt me," a ten days' trial of Postum in its place will tell the truth, and many times save life.

"There's a reason."

Look for the little book, "The Road to Wellville" in each package.

Painkiller PERRY DAVIS' CURES COUGHS, SORE THROAT

ness man fair wages for undertaking the management and starting of the business and the money you pay him will probably be spent better than any other you may invest.

If you wish the names of creamery supply firms to whom you may write for aid and suggestions regarding plans, machinery, etc., I think you will be fairly dealt with by consulting the firms advertising in HOARD'S DAIRYMAN.

I shall be interested in watching the progress you may make and hope you will not launch out into so large an undertaking as you have in mind, until you have carefully gone over all the different items and considered the question from all sides. If a creamery is started on a good substantial basis at the beginning, and if the building is well made and conveniently arranged, I think there is no doubt but the enterprise will be of great benefit to the entire community in which it is located.

COMPARISON OF MILK AND CREAM PRICES.

"Considering that we have milk containing 4% fat selling at 12 cents per quart, how much per quart ought we to receive for cream from this milk, if the cream contains 32% fat? Also, please advise what cream would be worth, when 4% milk sells for 10 cents per quart?"
Millwaukee, Wis.

* * * *

There are two ways of calculating the value of a quart of cream testing 32 per cent fat, when milk testing 4 per cent fat, sells for 12 cents a quart. The first and probably the easiest way of doing this, is to multiply the 12 cents a quart by 8, because 32, the test of the cream, is 8 times 4, the test of the milk, and the cream is 8 times as rich as the milk. This gives the price of a quart of cream testing 32 per cent fat as 96 cents.

When the 4 per cent milk sells for 10 cents a quart, the price of cream testing 32 per cent fat, will be 80 cents per quart if the calculation is made in the same way as the above.

The second method of making the above calculations, is the following:

We will assume that a quart of milk weighs 2 pounds; if it tests 4 per cent fat, each quart will contain .04 x 2 equals .08 pounds of fat. The fat in one quart of milk, or 08 of a pound of fat, is, therefore, worth 12 cents and on this basis one pound of fat will be worth $1.50. This is found by dividing 12 cents by .08, which gives the price received per lb. of butter fat when 4 per cent milk sells for 12 cents a quart. If a quart of cream testing 32 % fat weighs 2 pounds, there is in this quart of cream 2 x .32 or .64 pounds of fat, and if one pound of fat is worth $1.50 the .64 of a pound is worth $1.50 x .64 or 96 cents.

In this way we arrive at the same results as in the first method of calculating, but the latter method shows the price received per pound of fat. The value of a quart of 32 per cent cream, when 4 per cent milk sells at 10 cents a quart, is found to be 80 cents by this second method of calculation in the same way as illustrated above.

In these calculations the cost of skimming the milk and the loss of fat by the skimming is not taken into consideration.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35 00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre

NOW Is the time to Subscribe for **HOARD'S DAIRYMAN.**

HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If

GEORGIA Lands grow two and three crops a year. Stock require feeding and shelter but one or two months. All vegetables, garden produce, peaches, melons and all fruit get to Northern markets earliest, when prices are best. Land is cheap, about ⅓ the price in the cold Northwest. The climate is salubrious and more healthful than N.Y., Mass. or Ill. There's a whole lot you don't know about Georgia. It's our business to post you free if you will write us.

GREATER GEORGIA ASSOCIATION, - Atlanta, Georgia.

MURRAY'S LAND OFFICE,
WADENA, MINNESOTA

If you wish to do this, it will be fair to assume that the skim milk tests .1 of 1 per cent fat. Subtracting this from the test of the milk leaves 3.9 per cent fat as the amount which will be recovered in the cream, dividing the 32 per cent by this 3.9 instead of by 4, as we did in the former case, gives 8.2, which shows the number of times the cream is richer than the milk. This 8.2 may now be multiplied by the 12 cents per quart, and we obtain 98.4 cents as the price of a quart of 32 per cent cream when 4 per cent milk sells for twelve cents a quart. At 10 cents a quart the 32 per cent cream is worth 82 cents.

These calculations recognize the loss in skimming, but no estitmate of the cost of skimming the milk has yet been calculated. It will certainly cost something to skim the cream testing 32 per cent fat, and this ought to raise the value of the cream a certain amount above the calculations already given. The cost of skimming is something that cannot be estimated at a uniform price for all places. It will depend largely upon the amount of milk skimmed, as a thousand pounds may be skimmed much more economically per pound than 100 pounds and so on. It will be necessary for each man to make this calculation for himself.

Another thing which ought to be taken into consideration, if a person wishes to figure very closely on such a problem as this, is the fact that the weight of skim milk from a given quantity of milk is less than the weight of the whole milk. In the calculation above we reduced the test of the whole milk by .1 on the assumption that the skim milk tested .1 of 1 per cent fat. This .1 should not be taken from the entire weight of whole milk, because the skim milk is only about 70 to 80 per cent of the whole milk. The point, however, is a very fine one and

BUFF JERSEY'S CELEBRATED HERD OF JERSEY CATTLE WILL BE SOLD AT

AUCTION

On the 18th Dav of February, together with 25 Head of Berkshire Brood Sows.

This herd of Cattle has so wide a reputation that it is hardly necessary at this time to enlarge on their good qualities. Herd consists of 37 cows and heifers in milch, most of them either fresh or springers, 15 two-year-old springers, balance of herd young things. 28 of these cows have in the past year produced over 5000 pounds of milk each, several have passed the 7000 mark, average test has been above 5 per cent.

The Bull at the head of this herd has no Dam within three generations on either side that has a test less than 14 pounds of butter in seven days, and several above 20. The daily milk yield of any Cow in this herd can be seen as far back as 1899.

There will also be sold a full set of up-to-date Farm Machinery, Ensilage Cutter, Manure Spreader, Deering Corn Binders (2), Disc Plow, Surface Cultivators, etc. Full set of Creamery Machinery, 20th Century No. 3 De Laval Cream Separator, Power Churn 90 gallons, Mortis one pound butter printer, worker, etc. **Write for description of individual cows.**

Bids can be sent to us, accompanied by a certified check.

Cedar Hill Jersey Farm is 3 miles north and 1 east of Monmouth, Ill.

Address, BUFF JERSEY.

PROSPECT HILL JERSEY HERD
The cow that can DO something is what the farmers want. Eight cows have finished their official year's work making an average of 524 lbs. each. F. H. SCRIBNER, Rosendale, Wis.

VALLEY FARM is offering some bargains in young bulls sired by "Diploma's Victor, No. 56310, Grandson of "Brown Bessie," or will exchange for heifers equally well bred. For prices and pedigrees write Fred Stubley, Black Earth, Wis.

NAIAD OF ST. LAMBERT
Was a great cow. Aside from her official test she was a full sister of Mary Anne of St. Lambert (36.12 in seven days, 867.14 in a year) and her owner once refused $15,000 for her. Sale List A 21 contains a cow by a son of "Naiad", out of a grand-daughter of "Exile" with a weekly test of 19.10 and a milk record for one year of 11713 lbs., equal in butter fat to 739 9-10 lbs. butter. This cow is due soon to a grandson and great-grandson of "Naiad". Nearly all on this Sale List are deep in St. Lambert blood. It comprises fresh cows, cows nearing calving, heifers, and heifer calves. If interested write for pedigree of cow, and for List A 21.
WINTERGREEN HILL FARM,
SCOTTSVILLE, N. Y.

ROBINSWOOD JERSEY DAIRY has a few head of Young Jerseys, either sex, they are offering below their value, being overstocked. Also a few Barred, Buff, and White Plymouth Rock Cockerels, and one two-year-old Berkshire Boar, (registered.)

FOR SALE. Two A. J. C. C. Bulls ready for service; also some younger ones. Cows and heifers in calf to richly bred bulls. Write for pedigrees and prices. We have a few Berkshire Boar Pigs from unregistered sows left; cheap.
N. N. PALMER & SON, Brodhead, Wis.

POLLED JERSEYS
Richest Cow of all breeds in Pan-American Model Dairy. Winning Herd at Ohio and New York State Fairs, 1903. W. H. FORBES & CO., Yellow Springs R. R. No. 1, Ohio.

HILLCREST JERSEY HERD.
Bulls for sale out of famous St. Lambert Cows, headed by King of Hillcrest, 61858, by Hart's King of St. Lambert's King, 30752. Some fine Bull Calves and Bulls ready for service cheap if taken soon. For prices and pedigrees address
H. C. JOHNSON, GATES MILLS, OHIO.

probably would not be taken into consideration, because the variation from .1 of 1 per cent fat in the test of the skim milk will undoubtedly balance the difference between the weight of the whole milk and of the skim milk.

E. H. FARRINGTON.

Wis. Dairy School.

Prof. Farrington appears to have omitted from his calculation the value of the skim milk which is retained when cream is sold, which would be a half-cent or more per quart.

Utah Dairymen's Convention.

ED. HOARD'S DAIRYMAN:—Utah Dairymen's Annual Convention will be held at Logan, February 17th and 18th. The railroads are granting a round trip rate of one and one-fifth fare. Two hundred dollars worth of prizes are offered for butter and cheese on exhibition on a *pro rata* basis.

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdrpaint. It comes to the farmer a dry powder, and all that is required is cold water to make a paint weather-proof, fire-proof and as durable as oil paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, manufacturer, 406 North St., Adams, N. Y., and he will send you a free trial package, also color card aud full information showing you how you can save a good many dollars. Write today.

The Septic Tank Again.

ED. HOARD'S DAIRYMAN:—Replying to H. C. C. Co., Johnson Creek, Wis., I may say that I, the writer, cannot furnish the valve described, and have no interest, directly or indirectly in said valve. I can tell him, however, where he can get it, and the probable price. The valve mentioned is the invention of Mr. M.J. Quinn, an engineer in the Ontario Public Works office, and to this gentleman I am indebted for much valuable data relative to the construction and working of septic tanks. The Dominion Flushing Valve Manufacturing Co., 558 Dufferin St., Toronto, Ont., will furnish our correspondent with the valve, or as many as he may require. The price is about $25, according to size and quality.

As to the cost of building one of those tanks at a creamery I would say that such a tank, including automatic valve, could be constructed for $60, for taking care of the sewage of an average size creamery. All one has to do is to obtain the valve, and the rest of the construction is simple.

For private houses, outside of cities having a public system of sewerage, the septic tank furnishes the only solution. Cesspools are proved to be objectionable and dangerous to the life of not only the owners, but to the entire community, and under no circumstances should waste matter or sewage be buried deeply in the ground.

There is a growing desire, and a very laudable one, for rural people to have and enjoy the so-called modern conveniences, as hot and cold water bath, and water closet. These conveniences call for some system of sewerage. So far, or up to a short time ago, this want was supplied by the cesspool or privy pit, one of the most serious menaces to public health. To enjoy those modern conveniences and dispose of the sewage without danger to the inmates or to the community the septic tank comes into play, and does its work in a most natural manner by utilizing the process of nature for the purification of the wastes.

This natural process of purification is nothing more than bacterial action, where bacterial action actually is, near the surface of the earth. Down deep in the ground no bacterial activity takes place, and pollution is the result. As all know, sun, air and moisture are necessary to bacterial activity. This is why the pipes and tiles in the septic tank are kept so near the surface of the earth, that sun, air and moisture may penetrate down to where the waste is distributed.

The same microbes that cause vegetation and fertility in the soil, for the production of crops, decompose and utilize the wastes of the septic tank. The surface foot of the earth is provided with a most wonderful scavenger system, composed of millions of little workers to the cubic foot. These little workers are also found in vast numbers in water and air. The natural functions of many of those microbes tends to produce purification, and when one comprehends that sun and air are essential to the life of various species of microbes which are necessary to the proper decomposition of waste matter, it will be unnecessary to state that in the deep subsoil, as the bottom of a cess pool, where both are impossible, microbic life cannot exist, and instead of being converted into life producing matter at the surface of the earth with its dangerous properties destroyed, organic matter is allowed to decay and putrify in the deep, dead earth, until it is washed into some nearby well or stream there to cause the innumerable ills produced by drinking impure water.

It may be said that wells are too far removed from cesspools to be in any danger from this source, but experience has shown that the distance of one mile intervening between a dangerous cesspool and a well or stream of water does not guarantee immunity or safety. The power of mischief possessed by sewerage placed down deep beyond the action of bacteria is enormous, and the diffusibility of typhoid poison in water is practically infinite. Water containing the germs of disease may not be purified by filtration through a mile of solid earth. The greatest care should therefore be exercised in the disposal of waste matters, not only from creameries but from private houses, and that under no circumstances should they be buried deeply under the surface of the earth.

Of more importance perhaps is the adaptation of the septic tank sys-

INTENSE SUFFERING

From Dyspepsia and Stomach Trouble

Instantly Relieved and Permanently Cured by Stuart's Dyspepsia Tablets.

A New Discovery, but Not a Patent Medicine.

Dr. Redwell relates an interesting account of what he considers a remarkable case of acute stomach trouble and chronic dyspepsia by the use of the new discovery, Stuart's Dyspepsia Tablets.

He says: "The patient was a man who had suffered, to my knowledge, for years with dyspepsia. Everything he ate seem-

ed to sour and create gases in the stomach. He had pains like rheumatism in the back, shoulder blades and limbs, fullness and distress after eating, poor appetite and loss of flesh; the heart became affected, causing palpitation and sleeplessness at night.

"I gave him powerful nerve tonics and blood remedies, but to no purpose. As an experiment I finally bought a 50 cent package of Stuart's Dyspepsia Tablets at a drug store and gave them to him. Almost immediate relief was given, and after he had used four boxes he was to all appearances fully cured.

"There was no more acidity or sour, watery risings, no bloating after meals, the appetite was vigorous and he has gained between 10 and 12 pounds in weight of solid, healthy flesh.

"Although Stuart's Dyspepsia Tablets are advertised and sold in drug stores, yet I consider them a most valuable addition to any physician's line of remedies, as they are perfectly harmless and can be given to children or invalids or in any condition of the stomach with perfect safety, being harmless and containing nothing but fruit and vegetable essences, pure pepsin and Golden Seal.

"Without any question they are the safest, most effective cure for indigestion, billiousness, constipation, and all derangements of the stomach, however slight or severe.

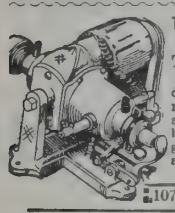
ADVANCE FENCE CO., 3327 Old St., Peoria, Ill.

tem to private houses. This importance is every day on the increase, *pari pasu* as more farm houses are putting in the so-called "modern conveniences." The cost of a tank adapted to the requirements of a private house is not beyond the reach of all, being not more than $40 or $50 in the sum total.

The septic tank system has the indorsment of all scientific men and engineers who have given the subject of sewage disposal close study. It will not give any trouble if built according to the directions given in the DAIRYMAN of Jan. 1st., and, contrary to the general supposition, it will not freeze in winter. If the distributing tiles, figure 2, page 1061, are placed under a garden or lawn, as might be easily possible on the farm, valuable results may be obtained in vegetable growth, as grass, fruit or vegetables. I may say that I have only great pleasure in giving this more detailed account, as the article of Jan. 1, was more of a mechanical nature, and did not give the full explanation of the working of the system, and the matter is not, thus far, well understood; for the system is but the outcome of the modern discovery of the function of germ life in agriculture.

P. E. I. J. A. M.



The Farmers' Course at the Wisconsin Agricultural College.

ED. HOARD'S DAIRYMAN:—Saturday, January 23d, finds us with fifty registrations for the Farmers' Course, beginning February 5th and lasting two weeks. A number of persons somewhat under twenty-five years of age have written, pleading for admission. We positively cannot accept persons under twenty-five years of age. The farmers' course is for busy farmers who cannot leave home for a longer time. Young men under twenty-five years of age should take the Short Course in Agriculture, which covers two winter terms of fourteen weeks each. They should not attempt to crowd into the two weeks' course, which belongs to mature farmers. Evidently we shall have all the people we can take care of when the two week's course opens, February 5th. W. A. HENRY, Dean.

College of Agriculture, Madison.

Sorghum for Silage.

Is it advisable to fill a silo with sorghum cane? If advisable an advantage would be that you can plant sorghum after oats and I think you can make more tons per acre. J. C. L.
Louisville, Ga.

Barring a single adverse report from Florida, in which sorghum silage may possibly have caused the illness of several cows, in some cases fatal, all the information that comes to us is favorable to the use of sorghum for silage.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Obstructed Teat.

In regard to your answer in the DAIRYMAN of Jan. 8, 1904, I followed your instructions, but it does not cure the cause. By taking the teat between the thumb and index finger, you can feel the lump just where the teat is grown to the udder if I might term it that way. By inserting the bistoury, you can readily feel when it goes through that obstruction; also in cutting it you could tell the instant the knife got through.
Lansing Mich. G. W. F.

ANSWER.

If you will make the opening large enough with your bistoury, the milk is bound to follow. You may also absorb the lumps by applying iodine ointment once daily after milking.

Urticaria.

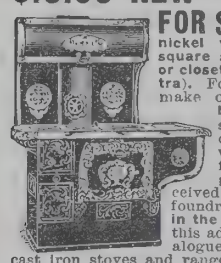
What makes my colt bite herself so? I have a 3-year-old colt; don't work or drive her much; use her on tread power to shred corn. She is very itchy; bites herself all over; bites her legs down to hoofs; no lice or sign of disease.
North Bangor, N. Y. T. R. W.

ANSWER.

See urticaria, this issue, and treat the same way.

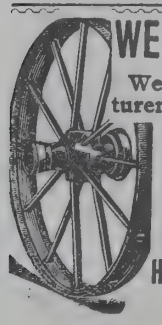
Diseased Tooth.

We have horse about ten years old with running sore on lower jaw; have had him 3 months and it keeps gradually getting larger. Do not know what caused it. Lump is about as large as a tea cup and very hard, a yellowish matter is continually discharged from it in two places.
Mountain House, Idaho. J. J. Q.

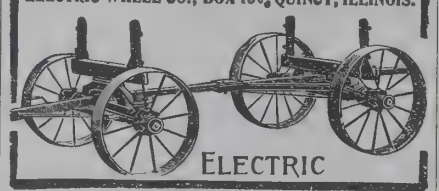


ANSWER.

The enlargement is due to a diseased tooth which has formed a fistula. Have the tooth extracted. It is possible that the jaw bone is also affected.



Sour Ensilage and Obstructed Teat.



I have a three-year-old cow that has been milking about three months; fed ensilage twice

ZENOLEUM
Famous *COAL-TAR* Carbolic Dip.
For general use on live-stock. Send for "Piggies' Troubles" and "Zenoleum Veterinary Advisor and learn its uses and what prominent stockmen say about it. Books mailed free. All druggists, or one gal., express paid, $1.50; 5 gal., freight paid, $5.25.

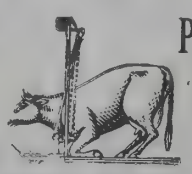
SUCCESS Manure Spreader



Leads every other machine for the mechanical spreading of manure. Its superiority appears in the fact that it is a distinct improvement on the Kemp Spreader, which we still manufacture and which has been the typical Spreader for 25 years. Spreads all manures of every character and condition and all commercial fertilizers. Pulverizes and spreads evenly, thick or thin, broadcast or drills in rows, any desired quantity per acre, unloading the largest load in 3 to 5 minutes; apron automatically returns to position in the next 65 feet driven.
A SPECIAL FEATURED MACHINE
for convenience of handling and perfection of work. Notably superior in its Beater Freeing device, Direct Chain Beater Gear, Speed Regulation and Automatic Return of Apron. Positive and dependable in all movements. Simplest in gear, lightest in draft, least chance for breakage. The driver never dismounts for any purpose but controls everything from his seat. Made in four sizes and sold under strongest guarantee as to materials, workmanship and duty. Investigate fully before buying. Catalogue with valuable chapter on farm fertilizing mailed free.

HOW HEALTH IS GAINED

The story of a great deal of the unhappiness of women is a story of lost health. Women wonder how it is that little by little the form loses plumpness, the cheeks grow hollow and sallow, and they feel tired and worn-out all the time. In a large proportion of cases when women are weak, run-down and falling off in flesh and looks, the root of the trouble can be traced to womanly diseases which undermine the general health. The proof of this is that women who have been cured of painful womanly diseases by the use of Dr. Pierce's Favorite Prescription have recovered their general health, gained in flesh and in appearance.

Dr. Pierce's Favorite Prescription cures the womanly diseases which sap the general health. It establishes regularity, dries weakening drains, heals inflammation and ulceration and cures female weakness.

"I suffered for three years with ovarian trouble," writes Mrs. Anna Quinn (Treasurer Woman's Athletic Club), of 602 Sycamore St., Milwaukee, Wis. "The treatment I took did not do me a particle of good, until a good neighbor who had been using Dr. Pierce's Favorite Prescription advised me to give it a trial. The next day took my first dose, and it was my first step toward recovery. In nine weeks I was a different woman; my flesh which had been flabby became firm, complexion clear and my eyes bright. It was simply an indication of the great change within from pain and suffering to health and happiness."

"Favorite Prescription" makes weak women strong, sick women well. Accept no substitute for the medicine which works wonders for weak women.

Dr. Pierce's Pleasant Pellets invigorate stomach, liver and bowels.

Calf Scours Don't let your calves die from this disease. You can save them by using Hood Farm Calf Scour Treatment, which consists of Calf Scour Cure, a liquid preparation which checks the scours, and Digestive Powder, a preparation of pepsin, which aids digestion, creates an appetite and keeps the calf from becoming stunted in growth.

HOOD FARM

Calf Scour Treatment

SAVES THE CALVES.

At Hood Farm, Lowell, Mass., in one year, there were 83 cases of scours. Every calf was treated with these remedies and all but 3 were saved. Formerly we lost 75 per cent. of all calves affected.

Two sizes of each remedy, $1 and $2.50, large contains four times the quantity of the dollar size. Prepaid to any railroad express point in U. S., 25 cents additional.

Address C. I. Hood Co., Lowell, Mass.

Mention this paper.

Spavin and Ring-bone

Once hard to cure—easy now. A 45-minute treatment does it. No other method so easy, quick and painless. No other method sure.

Fleming's Spavin and Ringbone Paste

cures even the very worst cases—none too old or bad. Money back if it ever fails. Lots of information if you write. Book about Spavin, Ringbone, Curb, Splint, Bog Spavin and other horse troubles sent free.

Our water supply tank is a great convenience. *We will send a Cooker complete and ready to use on* One Week's Free Trial. Catalogue free.

Purinton Mfg. Co. Dept. E, Des Moines, Ia.

and clover hay once per day; grain, 7 lbs. of Distillers dried grain. One night she stopped eating and the next morning one quarter of her udder was swollen and milk came in spray. I gave her salts and ginger and in two days she was all right except the teat still sprays and seems thick with a small scab in the orifice and it milks harder than the other teats. The ensilage is very acid, is that apt to injure the cows in any way? What should be done for the teat?
Plattsburgh, N. Y. L. R. P.

ANSWER.

If your ensilage is exceedingly sour it is advisable to feed it sparingly or mix with other food. The only remedy for the obstructed teat is the teat bistoury.

To Use the Bistoury.

I wish you would give me a few pointers how to use a teat bistoury, and how deep to cut and the price of a bistoury. G. W. F.
Lansing, Mich.

ANSWER.

Introduce the bistoury, allowing it to pass through the obstruction so that the blade will cut through its entire length, then cut in four opposite directions, guaging the size of incision according to the size of the obstruction.

A bistoury can be obtained from this office for $1.50 postage paid.

Unknown Disease.

I lost two cows that seemed to scour at first and then get weak, and they kept getting worse until they died. Am feeding good clover hay out of the mow, a little more than they clean at night, all the ensilage they will eat morning and night (ensilage never was better), with bran twice a day and plenty of good well water, but I cannot find out what is the matter. F. W. S.
Osawatomie, Kan.

ANSWER.

Your information and history of the cases is not sufficient to warrant a positive diagnosis, or even to make a guess at the cause of the trouble. A post mortem examination by a qualified veterinarian might throw some light on the subject.

Shrinkage of Milk.

I have a cow that aborted January 16, and I cannot get more than one quart a day from her. She was milking six quarts a day a week before, but dried up two days before she aborted.
Hibbing, Minn. J. W.

ANSWER.

When a cow aborts, the milk usually disappears in this way, but if you keep on milking her, and give good food it will come back in a short time. Be sure that the placenta is not retained, as this will prolong the trouble and keep the cow thin all summer. Applying massage to the udder before and after milking, increases its activity, if the cow is otherwise healthy, and has a good appetite.

Urticaria.

Have a cow that is affected with an itching, starting on the udder; first forms into a blister and by licking herself it forms into a scab and then seems to be all over her body more or less.
Williamsburg, Ia. W. S. S.

ANSWER.

The predisposing cause of this disease is overfeeding. Give a full dose of physic and follow with ½ oz. of nitrate of potash twice daily. The physic may be repeated in two or three days.

Wash the affected parts with a solution of sulphuric acid, ½ oz. to a pint of water; wash twice daily. Feed very light food to which you may add a little charcoal and sublimed sulphur once daily.

Warranted to give satisfaction.

GOMBAULT'S CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

"SAVE-THE-HORSE"
Registered Trade Mark
SPAVIN CURE

Marysville, Ont., Dec. 14, 1903.

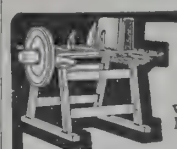
The Troy Chemical Co., Troy, N. Y.

Gentlemen:—My horse was affected with a thoroughpin which rendered her almost useless, although a valuable animal being one of a matched pair of roadsters. It was about the size of a goose-egg both inside and outside of the leg. I tried some of our best veterinary skill as well as different blistering medicines with no effect. I worked with it for about one year. Being a subscriber to the "Country Gentlemen" I saw your advertisement in it and determined to try it as a last resort as I was discouraged with everything else. When I had used the first bottle I saw a change. This encouraged me and I kept at it and completed a cure. I have no hesitation in saying that I believe "Save-the-Horse" is the best, and would advise all who have a horse so affected to use nothing but "Save-the-Horse". I give you permission to use my name. Yours truly J. G. ALLISON.

Columbus Grove, Ohio, Dec. 21, 1903.

One-third of a bottle of "Save-the-Horse" cured my horse of a spavin that had been fired and blistered several times in the past two years. M. M. OSBORN.

Califon, N. J.



Less than two bottles "Save-the-Horse" made a perfect cure on my horse that was affected with hip joint lameness. ADAM LANCE.

No man need see his horse suffer and become incapacitated. "SAVE-THE-HORSE" POSITIVELY AND PERMANENTLY CURES BONE AND BOG SPAVIN, THOROUGHPIN, RINGBONE (except low ringbone) CURB, SPLINT, CAPPED HOCK, WINDPUFF, SHOE BOIL, WEAK AND SPRAINED TENDONS AND ALL LAMENESS. Apply in all extremes of weather. Cures without scar or blemish or loss of hair. Horses may work as usual.

$5.00 per bottle. Written guarantee with every bottle. Constructed solely to protect you. Need of second bottle improbable, except in rarest cases. Copy of booklet and guarantee sent upon application.

Annual Meeting of Southern Wisconsin Cheesemakers' Association.

ED. HOARDS' DAIRYMAN:—The annual convention of the Southern Wisconsin Cheesemakers' convention will be held at Monticello on Thursday and Friday, February 4 and 5.

This convention is in the interest alike of the dairy farmer, the cheesemaker and the dealer. Their interest, to be mutually of benefit, should harmonize and the way to bring about harmony, is for all to meet and exchange their best thoughts in friendly discussion. The greatest losses arise from lack of uniform good quality in the cheese. The experience in other branches of this business has shown that uniform good quality can be brought about by meeting the best makers and learning and adopting their methods. Doing this will benefit all who take part in these meetings. Special benefit will result from getting the results of experiments and tests made at the expense of the state at the Wisconsin Dairy School. It is our duty to use our best efforts to make the most of our location in this, the most favored dairy region of this country. Our cheese need be second to no other of its kind anywhere.

There will be a fine exhibit of the various kinds of cheese, made by members of the association. There will be awarded gold and silver medals, finely engraved with the winner's name and score for first and second prizes Swiss, Block, Brick and Limburger cheese. Every other exhibitor whose cheese scores over 90 points will receive a diploma signed by the judges and by the president and secretary and share pro rata in a cash premium of $50. Exhibitors must be members of the association and will be limited to one exhibit of not less than thirty pounds each. No cheese shall be considered for prizes that has previously been bored or cut. Entry cards and directions will be furnished by the secretary, Henry Elmer, Monroe, Wis., who will also send membership cards upon payment of $1 each. All marks or cards showing the ownership of the cheese will be removed upon its entry. In no case will the name of any exhibitor be made known to the judges or others, until the award is announced.

Accompanying the foregoing statement Secretary Elmer announces the program for the meeting, which is as follows:

THURSDAY FORENOON.

Address of Welcome - J. C. Steinman.
Response.
President's annual address - - - - - - John Luchsinger, of Monroe.
Appointment of judges and commitees.
Paper, The Proper Care of Cheese While Curing - - - - Christ Bontley, of Monticello.
Inspection of Cheese Exhibits.

AFTERNOON.

The Babcock Test. Curd Test and Lactometer and How to Use Them, - - -
Asst. Dairy and Food Commissioner U. S. Baer, Madison.
Uniform Good Quality in Cheese - -
F. Marty, Instructor in State Dairy School at Madison.
The Present and Future of Our Dairy Industry - - - - - John Luchsinger, Monroe.

EVENING.

The Best Cow for the Cheese Dairyman -
- - - - F. Blumer, Farmers Grove.
How to Feed and Milk for Profit - -
- - - Jo Voegeli, Monticello.
The Model Cheese Factory, What it Should Be - - - - C. Marty, Brodhead.
The Farmer, the Cheesemaker and the Buyer Their Relations to Each Other - -
- - - - Thos. Luchsinger, Monroe.

FRIDAY MORNING.

Report of judges on cheese exhibits.
Award of prizes and testing prize cheese.
Statement by prize winners how prize cheese was made.
Address, Pure Milk and Its Capacity to Absorb and Impart Disease Germs - -
- - - Dr. D. Flower, Monticello.
Address, The Cold Storage Curing of Cheese - - - J. Karlen, Jr. Monroe.
Address, The Manufacture of Whey Butter.

FRIDAY AFTERNOON.

Report of secretary and treasurer.
Resolutions and reports of committees.
The Proper Time for Buying, Selling and Shipping Cheese - - - -
- - - - Ed. Wittwer, Monticello.
The Cheese Trade of 1903 - - -
- - - Jacob Regez, Sr., Monroe.
Our Failures and How to Profit By Them - - - Henry Elmer, Monroe.
Interesting discussions will follow each paper and address.

ALL our farmer readers who attend the two weeks Farmers' Course at the University, beginning February 5th, should bear in mind that the railroads will grant a third-fare rate on returning, providing the applicant secures a receipt for money paid when he buys his ticket for Madison. Take a receipt for each ticket you buy and have this stamped at Madison by Dean Henry. Then you can return for one-third fare. Dean Henry writes us that dozens of letters are coming to his office each day inquiring about the course or promising to be in attendance.

SEED CORN
AND ALL FARM SEEDS
ALWAYS RELIABLE AND BEST
BECAUSE they are fresh and NEW. Strictly Iowa grown and SURE TO GROW. Our big TWENTIETH Annual Illustrated Catalog tells you all about every FARM AND GARDEN SEED and crop that grows. It's FREE if you mention this paper. NO FAKES; FREE SEEDS; TRASH and other SCHEMES; but good RELIABLE Seeds CHEAPER than others sell at wholesale. If in want of Seeds send for our Catalog to-day.
RATEKINS' SEED HOUSE, Shenandoah, Iowa.

Corn
We challenge the world to produce a more prolific, early, big eared corn variety than **Salzer's Home Builder**, so named because 50 acres of this fine corn yielded so heavily in 1902, that its net proceeds built a beautiful home for the lucky possessor. See catalog.
Here are some of the yields our customers had of this corn in 1903:
157 bu. per acre. By John Flagel, La Porte Co., Ind.
160 bu. per acre. By O. E. Michael, Mont. Co., O.
196 bu. per acre. By Richard Spaeth, Lake Co., Ind.
198 bu. per acre. By J. D. Walker, Hamblem Co., Tenn.
220 bu. per acre. By Lawrence Scheistel, Ogemaw Co., Mich.
225 bu. per acre. By J. W. Massey, Crockett Co., Tenn.
804 bu. per acre. Ray Stearns, Ransom Co., N. D. says: "Ripened in 120 days. Yielded 304 bu. per acre. Next year I will grow 400 bu. per acre from it."
National Oats. Enormously prolific. Does well everywhere. It won't let your acre produce less than 100 bu. Try it.
Billion Dollar Grass. Most talked of grass in America. Would be ashamed of itself if it yielded less than 14 tons of splendid hay per acre.
For 10c. in Stamps and the name of this paper, we will gladly send you a lot of farm seed samples, well worth $10.00 to get a start with, together with our mammoth 140 page **illustrated catalog**, describing such novelties as Arid Land Barley, Macaroni Wheat, Two Foot Oats, Pea Oat, Teosinte, Victoria Rape. Send the 10c. today.

Salzer's Alfalfa sinks its roots 10 to 20 feet after nourishment and moisture.

Glory enough! Ring the bells! Shout for joy! The year of jubilee has come! How's that? Why, sir, **it is now possible to grow Alfalfa Clover in every State of the Union, North, South, East or West**—why, sir, cold Minnesota, and freezing Wisconsin, and treeless Nebraska, and the prairies of Illinois and Iowa, and the bottoms of Indiana, and the pineless soil of Michigan, and the rich farms of New York and Pennsylvania—yes, every state can grow from two to four crops of Alfalfa, if **Salzer's Northern Alfalfa seed is used!** That's acclimated, that's hardy, that's tough, and we believe tougher and better than the Turkestan Alfalfa.

A grand Clover—the eternal Clover of Europe and Mexico. Our attention thereto was first attracted in 1885, by a large patch near La Crosse, holding its own through an unusually cold winter and spreading rapidly. Since then we have sold enough seed in Iowa, Wisconsin, Illinois, Minnesota, Missouri, Nebraska, Kansas, Indiana, Michigan, Ohio, Pennsylvania, New York and other parts to sow 500,000 acres, and have the first complaint to hear on same.

How do you like these Testimonials:

Hon. H. F. Hunter, So. Dakota. Your Northern Grown Alfalfa Clover is immense. Every kernel grew. I have solved the question of stock raising here—Salzer's Alfalfa—good for 3 rousing hay crops; Salzer's Speltz for 60 bushels grain and 3 tons hay; Salzer's Macaroni Wheat for 65 bushels per acre, and your Beardless and Moravian Barleys—these items, with your Billion Dollar Grass, Earliest Cane and Fodder Corn, make it possible for me to grow hogs and cattle galore!

Orin Smith, Pike Co., Mo. I bought 60 pounds of Salzer's Alfalfa last March. At this writing, Sept. 9, 1903, I report three tons of Clover hay, and will have splendid pasture until November besides. In 1904 I'll cut three crops sure!

A. E. Walford, Westlore Farm, Pa. Your strong description of Salzer's Alfalfa Clover induced me to sow 100 pounds. This I put on five acres, and Oh, the splendid results! I wish you could see my fields now! I have over 60 acres in Salzer's Alfalfa. I cut three crops this season, and have lots of splendid pasture besides.

BOWLING GREEN, KY., Aug. 31, 1903.
John A. Salzer Seed Co.
Gentlemen: I bought some Alfalfa Seed of you a year ago last spring. I made a great success of it. I have already cut three crops this summer. It does splendidly on limestone soil. I intend to sow this fall on wheat five or more bushels of Alfalfa.
Yours truly, L. SCHUJAHN.

Carl G. Kleinstueck, Saxonia Farm, Mich., has this to say: "I have a patch of Salzer's Alfalfa Clover that I seeded 13 years ago, which yielded four big crops last year, besides good fall pasture. It has been cut three times already this season, and the fourth crop is about 6 inches high today, and will be ready for mowing in less that three weeks."

For 6 Cents.

If you will cut this out and send same with 6 cents in stamps, we will mail you a sample package of **Salzer's Northern Grown Alfalfa Clover Seed**, as also our catalogue that contains the full description of how to grow with success this wonderously luxuriant hay and grass producing clover. Send today 6 cents in stamps for above and be sure to mention HOARD'S DAIRYMAN.

Salzer's Bromus Inermis Grass Seed.

In Dakota, Bromus Inermis yielded for us 1901, 1902 and 1903 at the rate of 7 tons of hay per acre.

JOHN A. SALZER SEED COMPANY,
La Crosse, Wisconsin.

A Pennsylvania Herd Record.

ED. HOARD'S DAIRYMAN:—Enclosed you will find an official account of my cows, from the Johnstown Sanitary Milk Co., giving the weight, test, and amount of gallons and the price received for same. This last fall, the minister of our county seat, which is about one-twentieth the size of Johnstown, wanted the managers of our County fair to run the fair something on the church style, which would not pay, so they came to the conclusion to hold the County fair in Johnstown, which took up some time before they could agree and they only had two weeks to advertise, so a good many farmers claimed they had too short a time to get their stock in shape to be put on exhibition. They never held a county fair in Johnstown, so they sent to Mr. Benninger, the Holstein cattle man and brought him here, and there were some other people that showed their stock.

I started in the dairy business about six years ago, never thinking about cows before that; in fact, I always lived in the city and followed butchering and hotel keeping, but I have the credit of being the leading dairyman in this part of the state. Whether I am or not, I always leave that to the people.

MILK RECEIVED FROM H. K——.

1903 MONTH.	Pounds.	Gallons.	Test.	Amount.
April	12129	1455	5%	$327.39
May	18193	2183	4.7	461.70
June	17454	2094	4.7	442.88
July	18344	2201	4.9	485.32
August	16234	1948	4.8	420.77
September	13366	1604	4.9	353.68

The most cows we milked at any time this summer was 28 head, 22 Jerseys and 6 common, but next summer I will have 42 Jerseys and no common ones in the flock, and I do not want milk to run below 5½ fat. So the Fair people asked me whether I would not help them out this time as they want to hold a fair each and every year. I told them that I did not keep my cows for that purpose, but would help them out and show the farmers around here that they should have their stock ready to show them at any time, even in dead of winter. My stock is always ready for inspection, each and every day in the year.

I was busy with my fall work and two hands short, so the day the fair opened I went in my barn and untied 21 head of cattle, without knowing one minute before I went in which I would take, so I took all that would be fresh within the 90 days, thinking it would be too cold for good and fresh milkers. I only live one mile from the race track and I kept 21 head of cattle at home; took 6 hogs, 3 horses and one bushel of potatoes. I never was at a fair before, so I did not know how to enter my stock. I saw Mr. Benninger and he helped me and showed me how. I entered two between 1 and 2 years, two from 2 to 3 years, two from 3 to 4 years, and two from 4 and over, and the bull. They had no more classes for the other cattle. I had one yearling colt and a suckling, full brothers, and the old mare which I bought for $10, and $10 in milk, when I started in to peddle milk; I entered six hogs, and one bushel of potatoes. There were 41 other potato exhibitors there against me, and I took all the first and second money that I was contesting for, and the association was so well pleased, and the papers were full every day during fair week about my stock, that they gave me my entry fees back and the money that I won.

I think it funny that people have to have a month to fix up their stock. It matters not where I am, I always get home to see my stock every day, and see that they are all right, and I don't find it hard to keep them in the pink of condition, by looking after them myself; then I know they are all right. I have learned all I know by hard work and studying the cow. We certainly have a fine herd, and I am very proud of them. There are as high as forty people at our place on nice Sundays to see the stock, from the city, as it is only 5 minutes walk from car line. We groom our stock all the

BURPEE'S Farm Annual

"THE LEADING AMERICAN SEED CATALOGUE," is now more "a leader" than ever before. Thoroughly revised and greatly improved, it tells not only THE PLAIN TRUTH about seeds, but has also **many new features for 1904.**

An elegant book of 178 pages, it contains hundreds of illustrations from nature and **six superb lithographic colored plates.** It shows in natural colors thirteen "true and tried" new Vegetables of sterling merit, three new Nasturtiums (of a distinct type), and seven Superb Sweet Peas,—all painted from nature, by New York's leading artist, at our famous FORDHOOK FARMS.

It presents also *twenty-one faithful photogravures* of America's Largest Mail-order Seed Trade,—views in both town and country. Altogether it is pronounced the

Best Seed Catalogue Ever Published

And it's Free! provided you will *ask for it now.* **It will cost YOU one cent** to mail your address on a postal card to us. It will cost us four cents postage—plus eight cents for the catalogue,—just **twelve cents** to respond to your request.

We are willing to bear this risk—**twelve for one!** ☞ If you will only read

BURPEE'S FARM ANNUAL for 1904

we feel quite sure that you will favor us with **at least a trial order,** and this is all we ask, as BURPEE'S SEEDS will tell their own story in your garden and fields.

Better send for this catalogue **to-day!** One cent spent by you insures twelve cents spent by us, and this should be sufficient to convince you that we have *faith* in BURPEE'S SEEDS and also in our ability to persuade you **to try Burpee's Seeds,** if you will only read BURPEE'S FARM ANNUAL.

Are you willing to spend that cent?

Shall we hear from you? If not, YOU will miss an opportunity to become acquainted with **the very BEST SEEDS that can be grown!** ☜

time as they pay us big money. I have no more time to write, but could fill a good many pages. If nothing happens I expect my herd after the first of March next to average me $600 a month.

I will have 42 good Jersey cows the year around, nearly all my own raising. I have some that give 44 to 46 pounds of milk when right and fresh. My main feed of grain is bran, and the best low grade flour that I can get. I have nearly all the different dairy feeds, but I think this beats them all.

Johnston, Pa. H. K.

Corn and Cow Peas.

ED. HOARD'S DAIRYMAN:—In regard to the pictures of my corn and cow peas, and cane and cow peas, as published in DAIRYMAN on page 1059, I can say these were the heaviest, best paying crops I ever raised. We planted the corn and cow peas the last week in May, We first prepared ground by plowing and harrowing as usual for a good seed bed, first, before plowing, applying a good dressing of cow manure. When we had the ground ready, then we planted the corn first, and as soon as we had a half day's planting done, we turned around and taking our corn plates or droppers out, we put in plates to drop the cow peas, and going right over the same rows, dropping or planting the peas. This is double work. We ought to have a planter that would plant both at once, but this is the best way that we have until we have a planter that will plant both at once. I wish some one would make a planter right now, so I could get one to use this spring, as I shall never plant another row of corn without cow peas in it.

We have now been planting this way three years, and we like it better every year. It is good for the ground to keep up the fertility, and the very best crop to go into the silo, as it grows up together, and it is done without any extra work in cultivating or harvesting; only we have a corn harvester to cut the corn with on account of the vines, but that is the best way to grow corn and peas for the silo, to have them equally mixed, and the best and quickest way to handle them. It is all done at one operation, and is no more work than to handle just the corn alone, only the pea vines attach to the corn; so you see the advantage in planting them together.

We drill the corn and drop one kernel every 10 or 12 inches apart and the cow peas every 6 inches, or you can drop them to suit yourself, it depends on whether you want them thick or thin. Some think that the cow peas won't do any good in the corn if the corn is planted the usual way with an ordinary planter. In those pictures you saw in the DAIRYMAN, the planting was just as I stated and the vines ran to the top of some of the stalks as you can see, and "seeing is believing" as the old saying is, and the vines cover the ground between the corn rows and keep the weeds and grass down.

I think it an advantage all around for the farmer that grows corn, and don't want the roughness of fodder for feed, just to keep up the fertility of the land. There is a great difference in the growth of the cow peas; some do not do well in corn, but others do. The Whip-poor-will and Clay are the best so far.

I have tried different kinds. The Clay will keep right on growing until frost stops them; the Whip-poor-will gets ripe at a certain age and then if you don't watch them they will drop the leaves. So will the Black drop the leaves at a certain stage and then there is nothing left but the naked vines. So it depends a great deal on what variety you plant. We mixed the Clay and Whip-poor-will last year, equal parts. There may be some other varieties that are better than these, that I have not tried and if some one finds some other kind that does better, I would be thankful to learn about them.

Please let us hear from all dairymen about growing our one cow feed on the farm. I have gotten much good advice, in fact, I can say that if I had not gotten into dairy farming and had the advice from the DAIRYMAN how to improve my land and cows I would not have been as well off as I am now. Therefore I can say that advice from the DAIRYMAN can be relied upon, especially the dairy type cow for a special dairy purpose.

We have found it to be true, if you want to make a profit you need a good dairy cow that will give milk 10 months out

FREE VETERINARY ADVICE DURING FEBRUARY

Until March 1st, Dr. Hess (M. D., D.V. S.) will furnish every reader of this paper a letter of advice, and a special stock prescription, free of charge. This information is free to the users of Dr. Hess preparations at all times, but this month we offer it to those who have never used our goods as a means of demonstrating Dr. Hess' ability to formulate stock preparations. If you are in need of special veterinary advice, describe your difficulty fully in a letter to Dr. Hess & Clark, Ashland, Ohio, care Information Bureau, and the letter of advice and prescription will be furnished you free, providing you state what stock you have (number of head of each kind), what stock food you have fed, and mention this paper. Enclose 2c stamp for reply.

Milk is a very complex fluid, containing all the elements of the animal body. The food, therefore, to produce it should be rich in all these elements. The error too frequently committed by dairymen is in supplying a ration from one kind of food instead of giving a variety. It is a fact that butter has a higher flavor when produced from hay cut from an old meadow, because old pastures seldom contain less than 12 to 15 species of grass. It requires two thirds of the full ration of the dairy cow to keep up the animal heat and supply the necessary waste. If the system of the animal is in poor condition, it requires more. By adding Dr. Hess Stock Food, the great cow tonic, to the food regularly as directed, the digestion is kept in perfect order and every particle of the nutrition is extracted from the food eaten, and is applied to fat, bone, muscle and milk formation; thus, less food is required to keep up the animal system, and more goes to produce profit.

Dr. Hess Stock Food

is the only scientific stock food on the market. It is sold on a written guarantee; it is formulated by Dr. Hess (M. D., D.V.S.) If these institutions of learning know of nothing better, it must be good. No unprofessional manufacturer can equal it.

Dr. Hess Stock Food is sold on a written guarantee, 100 lbs. for $5.00 (except in Canada and Pacific Slope) smaller quantities at slight advance. Fed in small dose.

Our Information Bureau.—For any disease or condition for which Dr. Hess Stock Food is not recommended, a little yellow card enclosed in every package entitles you to a letter of advice and a special prescription from Dr. Hess (M. D., D. V. S.). In this manner you are provided with a universal treatment for all stock difficulties either in the stock food itself or in the special prescription to which the little yellow card entitles you. Endorsements from physicians, scientists and stock feeders furnished on application.

DR. HESS & CLARK, Ashland, Ohio.

A New Era

in windmill making began with the birth of the

Samson Windmill

It is not like any other—**it is better.** It is the one with which dealers and salesmen draw comparisons. "Just as good as the **Samson**" has become a favorite subterfuge with them. They know very well nothing is the equal of the wonderful Samson with its Double Gear; its long shafts; and long bearings with detachable boxings; its perfect center line draft, direct lift and absolute freedom from all torsion and overhanging strain. The Samson never "wobbles" in the wind. The wheel and vane are sensitive to the slightest wind. It pulls the water from the deepest well with perfect ease, because it distributes the strain over four bearings instead of one as in case of all the other mills. Every mill is equipped with our large capacity, deep cup, cable feed self oilers. It makes the oiling sure and cups only need to be filled at long intervals. We can't tell all about it here. We will mail free the handsomest and most complete windmill catalogue ever published if you ask for it. It tells just how the Samson is made and illustrates each separate part. Write for it at once.

The Stover Mfg. Co.,

552 River St. Freeport, Ills,

12, good, rich milk. I would like to hear from all the good dairymen that are in good earnest about dairying, to tell us how they are getting along in grading up their herds; whether they are getting better cows at each cross. I can say that we have been successful every time in getting a better cow with each cross by using a thoroughbred sire each time.

Concordia, Mo. WM. H. BRUNS.

After Reading the "Dairyman" One Year.

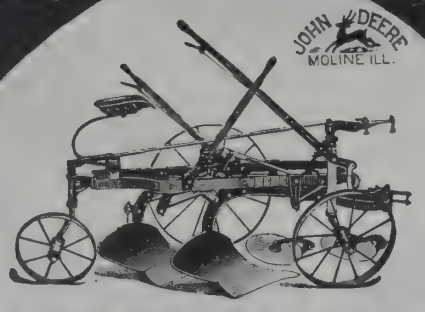
Some Remarks and a Few Questions.

ED. HOARD'S DAIRYMAN:—Until last January the writer was one of those "hard headed farmers" that John Gould talks about, who won't feed cows anything but ground corn and oats mixed with wheat bran. At about that time prices for the above mentioned articles began to hunt the sky parlor, taking profits out of sight, (corn, 60 cts.; oats, 50 cts.; bran, $22 per ton.) Meeting a brother dairyman one day I began telling him my troubles and his advice was "subscribe for the HOARD'S DAIRYMAN and have them make up a ration for you; it will pay you." As he is a successful man, I took his advice and in the first issue I received, some other fellow in trouble had asked as to the comparative value of several different feeds, among others as to the value of wheat bran at $18 per ton to 4 X distillers grains at $25 and the reply was that in his case the grains were the cheaper for him. I knew nothing in a practical way of distillers grains, but knew they were on sale at a feed dealer,s in our town for $22 per ton, the same as bran was selling for. This got me to thinking and I did'nt miss a word in that issue in regard to rations. When I had the sum of the different answers given fixed in my mind, I started for town and came home with a load of feed made up of the following: corn bran at 90 cents per hundred, dried grains at $1.10 and royal oat feed at 60 cts. Out of these I mixed a ration that cost $2.00 less per week of the new ration for my 11 cows, than my old corn, oats and bran one, and I received the first week $1.20 more for my milk than I received the last week of the old. So the first issue of HOARD'S DAIRYMAN saved me $3.00 the first week after I received it.

I have varied my ration some since that time and believe could now show greater profits over the old one.

What is the feeding value of cotton seed hulls? They are being sold here at $12 per ton. I can see no such value in them from your analysis given some time since in the DAIRYMAN.

What value has clover seed chaff and stalks as compared to clover hay at $12 and good corn fodder at $6 per ton?



As to concentrated foods, we have dried brewers grains shipped here bearing an analysis of protein and fat 32 per cent, guaranteed, selling at $20 per ton, also a molasses and grain combination, with an analysis of protein, 21 per cent, fat 3 per cent, selling at $18 per ton. Corn bran at $18 per ton, Royal and Vim oat feed at $11, old process oil meal at $26, XXXX distillers grains at $23 and wet brewers grains at 10 per bushel, the last two are not always to be had.

My present ration is 140 lbs. of the first mentioned grains, 125 lbs. corn bran, 100 lbs. "Vim" oat feed, 25 lbs. oil meal, 1 lb. Dr. Hess stock feed. (The amounts are given this way because size of sacks makes it easy mixing.)

This ration costs me 68 cents per week for each cow outside of roughage, which is as much good corn fodder as they will clean up, at present prices worth about 25 cents a week, or 93 cents, all told per cow. My returns are a little over $2 per week for each cow owned, 13 in number, getting 12 cents a gallon for milk at my door. I am breeding my cows and the above number includes two dry ones. Would like to have any suggestions as to change in my ration. Don't be afraid to criticize, as I am not at all thin skinned.

Dayton, Ohio. ALMIRWIN.

Where one is receiving "a little over $2 per week" for an investment of only 93 cents in feed, it is somewhat dangerous to experiment in changing the kind or amount of feed. Certainly we could not advise feeding cotton seed hulls at the price named, and we have no data as to the feeding value of clover seed chaff and stalks, but it cannot, in the nature of the case, be very great.

NEW DEERE

King of all Riding Plows

Three times as many in use as of any other style or make of Riding Plow.

Good For a Generation.

Comanche, I. T., November, 7, 1903.

DEERE & CO.,

Gentlemen: Please send me two wheel boxes No. 95 for my Sulky Plow and oblige.

These repairs are for a John Deere Plow my father bought in Sherman, Texas, twenty-seven years ago. It is a good plow yet, except the boxes for the wheels. It was run on black land twenty years and I have run it on sandy land seven years.

Yours truly, W. A. BOWLES.

Every John Deere Plow is Made to Wear Like That.

DEERE & CO., MOLINE, ILL.

See your dealer and insist upon getting a John Deere Plow.

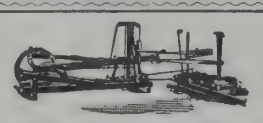
5.95 Stitched with Silk.

SEND NO MONEY WITH ORDER.

We have advertised in HOARD'S DAIRYMAN many years, and have found their subscribers among our very best customers, and to be conscientious and responsible. We are therefore going to make to the subscribers of this paper one of the most liberal propositions ever made, which is as follows: **This offer will not be made again. Order now.**

SEND NO MONEY Cut this ad out and send it to us. State number of inches around the body at chest, close up under arms, over vest, also number of inches around body at waist just above the hips, number of inches around body at (hips) largest part, also length of pants leg inside seam, from tight in crotch to heel, and we will send you by express this handsome black or dark blue suit **FREE** When it arrives at your express office examine it carefully, try it on, and if you find it exactly as represented by us, strictly all wool, made in the latest style, and cut for season of 1904, to be a better fitting suit, better made, more serviceable, more stylish, and better in every way than any suit you can buy of any other house in Chicago, or in fact from any where else, or of your local dealer at home at less than $14.00 to $16.00, pay the express agent our special price of $5.95. If the suit does not prove to be exactly what you want, satisfactory in every way, equal to suits that sell everywhere at $14.00 to $16.00, then ship it back to us and we will pay the express charges both ways. Understand, we do not ask you to send us one single cent with the order. **All that is necessary to do is to send us this ad, give us your full measuremen as indicated above, and say whether you want a black or blue suit, and we will ship you this handsome suit at once.** Do not be afraid you cannot take your own measure. Do not be afraid the suit will not fit you. Take your measure carefully and the suit will surely fit you perfectly. If it does not fit perfectly, if it is not satisfactory in every way, and the biggest bargain you have ever seen, and equal to suits that retail everywhere from $14.00 to $16.00 you need not pay one cent to take it from the express office, but you may send it back to us, we'll pay express charges both ways.

Our 15 Days Trial Proposition.



Wear this handsome suit 15 full days. In the meantime compare it with suits your friends have bought at home or elsewhere, and if you do not find our suit superior in quality, style and tailoring, and general makeup, and if it is not worth more than your friends have paid for suits at $14.00 to $16.00, return it to us and we will refund you your money, and pay all express charges so you won't be out one single cent. **Order today and wear a $16.00 suit at $5.95.**

THIS HANDSOME SUIT is made of a fine quality all wool cheviot, black or dark blue. Say what color you want when ordering. The coat is made in the semi-military fashion, round cut sack, like illustration; has broad padded shoulders, giving the shoulders a broad dressy effect; has double interlined canvas self-sustaining front, is neatly lined with strong farmers satin, has four outside and one inside pocket, vest is single breasted, made in the best of manner with notched collar, nicely lined. The trousers are made full medium wide, cut over the latest pattern. This is a suit that keeps its shape, and will give the wearer the very best service. We use in this suit better linings, trimmings, interlinings, stiffening and finish, than any other maker. We employ none but the very best of cutters and fitters, and we guarantee to give you a more stylish, a better made suit every way, shape and manner, than you can buy anywhere else without paying from $14.00 to $16.00.

5.95 Buys a $16.00 Suit. Order Now or Write for our Large Free Catalog.

OUR SPECIAL PRICE OF $5.95 Barely covers the cost of the cloth, lining, trimmings, and tailoring. We are making this special offer merely to introduce our clothing in your vicinity and to place one of our catalogues in the hands of every subscriber to this paper. We are only able to make this extremely low price because of our extraordinary facilities for buying and manufacturing, and because of our large volume of business. **Order today, and with the suit we will send you one of our large complete catalogues;** or, if you prefer a suit different from our special $5.95 suit, as described above, write us for our clothing catalogue. State in your letter the kind of suit you want and we will send you samples.

DO YOU WANT MORE MILK?

MADE HIS COWS GAIN 2 LBS. PER DAY

MILTON JUNCTION, WISCONSIN.

International Stock Food Co., Minneapolis, Minn.

GENTLEMEN:—I made a test of **"International Stock Food"** on nine cows last spring, for 14 days, using the same amount of grain as I had been feeding them, and they gained 248 pounds in the 14 days. I will take my oath on this statement. **"International Stock Food"** also saved the life of one of my best cows. Yours truly. T. McRAE, JR.

We Have Hundreds of Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine.

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed "International Stock Food" every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:56¼, DIRECTUM 2:05¼ and Roy Wilkes 2:06½; and also to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" 3 FEEDS FOR ONE CENT is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite, Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It will make your Calves, Colts or Pigs grow amazingly and will keep them healthy. It is Absolutely Harmless even if taken into the Human System. You insist on eating the following medicinal ingredients with your Own food at every meal: Table Salt is a stomach tonic and worm medicine, Table Pepper is a powerful stimulating tonic, Table Mustard is a remedy for dyspepsia, Table Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper and Over One Million Progressive Farmers and Stockmen. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Sixty-five Thousand Dealers throughout the World, and has the Largest Sale ever known. ☞Your Money will be Promptly Refunded in Any case of failure. We Refer You To Any Bank Or Wholesale House In Minneapolis. ☜Beware of the many Cheap and Inferior Imitations now on the market! No Chemist can separate and name all the Different powdered Roots, Herbs, Barks and Seeds that we use in our preparations. Any Chemist or Manufacturer claiming to do so Must be an Ignoramus or a Falsifier. Imitations Are Always Inferior. Insist On Having The Genuine And You Will Always Obtain Paying Results.

The Following is a Complete

List of Premiums

Given for New Subscribers to

HOARD'S DAIRYMAN.

We much prefer to send them out as such; however, to those who are unable to secure subscribers, they will be sent postpaid on receipt of price.

FOR **ONE** NEW SUBSCRIBER.....
We will mail you, postpaid, "THIRTY YEARS AMONG COWS, by N. B. White. Paper bound, 120 pages. Price postage paid 50c.

FOR **ONE** NEW SUBSCRIBER.....
We will mail you "A BOOK ON SILAGE," paper bound, 200 pages. Price postage paid 25c.

FOR **ONE** NEW SUBSCRIBER.....
We will mail you, postpaid, "DAIRYING FOR PROFIT," by Mrs. E. M. Jones; paper bound, 65 pages. Price postage paid, 25c.

FOR **ONE** NEW SUBSCRIBER.....
We will mail you, postpaid, "A B C IN CHEESE MAKING," by J. H. Monrad; paper bound, 68 pages. Price postage paid 50c.

FOR **ONE** NEW SUBSCRIBER.....
We will mail you, postpaid, "A B C IN BUTTER MAKING," by J. H. Monrad. Paper bound, 68 pages. Price postage paid 50c.

FOR **ONE** NEW SUBSCRIBER.....
We will mail you, postpaid, "CHEESEMAKING IN SWITZERLAND," by J. H. Monrad, (Emmenthaler, Etc., Brick and Limburger): paper bound. Price postage paid 50c.

FOR **ONE** NEW SUBSCRIBER.....
We will mail you, postage paid, "PASTEURIZATION AND MILK PRESERVATION," by Monrad; paper bound, 80 pages. Price postage paid 50c.

FOR **TWO** NEW SUBSCRIBERS.....
We will mail you, postpaid, "MILK TESTING," by Schoenman; 50 pages, cloth binding. Price postage paid 75c.

FOR **THREE** NEW SUBSCRIBERS.....
We will mail you, postpaid, "TESTING MILK AND ITS PRODUCTS," by Profs. Woll and Farrington; cloth bound, 250 pages. Price postage paid $1.00.

FOR **THREE** NEW SUBSCRIBERS.....
We will mail you, postpaid, "MILK AND ITS PRODUCTS," by Prof. H. H. Wing; cloth bound, 280 pages. Price postage paid $1.00.

FOR **THREE** NEW SUBSCRIBERS.....
We will mail you, postpaid, "THE SOIL," by Prof. King; cloth bound, 300 pages. Price postage paid $1.00.

FOR **THREE** NEW SUBSCRIBERS.....
We will mail you, postpaid, "AMERICAN DAIRYING," by Gurler; bound in cloth; 266 pages. Price postage paid $1.00.

FOR **THREE** NEW SUBSCRIBERS.....
We will mail you, postpaid, "ELEMENTS OF DAIRYING," by Decker. Price postage paid, $1.00.

FOR **THREE** NEW SUBRCRIBERS.....
We will mail you, postpaid, "THE CARE OF ANIMALS," by Mayo. Price postage paid, $1.25.

FOR **THREE** NEW SUBSCRIBERS.....
We will mail you, "BEHREND'S COMPUTER FOR CREAMERY AND DAIRY, cloth bound. Price postage paid $1.00.

FOR **THREE** NEW SUBSCRIBERS.....
We will mail you, postpaid, "OUTLINES OF DAIRY BACTERIOLOGY," by Prof. H. L. Russell; cloth bound. Price postage paid $1.00.

FOR **FOUR** NEW SUBSCRIBERS.....
We will mail you, postpaid, "CHEDDAR CHEESE MAKING," by Decker; cloth bound, 192 pages. Price postage paid $1.75.

FOR **FOUR** NEW SUBSCRIBERS.....
We will mail you, postpaid, "FEEDS AND FEEDING," by Prof. W. A. Henry; cloth bound, 650 pages. Price postage paid $2.00.

FOR **FOUR** NEW SUBSCRIBERS.....
We will mail you, postpaid, "DISEASES OF HORSES AND CATTLE," by Prof. D. McIntosh; bound in cloth. Price postage paid $1.75.

FOR **FOUR** NEW SUBSCRIBERS.....
We will mail you, postpaid "WOLL'S MODERN DAIRY PRACTICE," bound in cloth, 285 pages. Price postage paid $2.00.

FOR **FOUR** NEW SUBSCRIBERS.....
We will mail you, postpaid, "WOLL'S HANDBOOK FOR FARMERS AND DAIRYMEN," cloth bound, 375 pages. Price postage paid $1.50.

FOR **FOUR** NEW SUBSCRIBERS.....
We will mail you, "PHYSICS OF AGRICULTURE," by King; cloth bound, 604 pages. Price postage paid $1.75.

FOR **FOUR** NEW SUBSCRIBERS.....
We will mail you postpaid, "BUTTER FAT AND DIVIDEND CALCULATOR," by Schoeman; cloth bound, 66 pages. Price postage paid $2.00.

FOR **TEN** NEW SUBSCRIBERS.....
We will mail you, postpaid, NEWTON'S COMPUTATOR. Price postage paid $4.50.

FOR **ONE** NEW SUBSCRIBER.....
We will mail you, postpaid, PILLING'S SOLID COIN SILVER MILKING TUBE. Price postage paid 40c.

FOR **THREE** NEW SUBSCRIBERS....
We will mail you, postpaid, MOORE'S BROS.' SAFETY MILKING INSTRUMENT. Price postage paid $1.00.
